Welcome

Welcome to the IBM watsonx Assistant for Z for Technical Sales Level 4 Lab Guide (lab guide). The lab guide is part of the IBM watsonx Assistant for Z for Technical Sales Level 4 learning plan for IBM and Business Partner Technical Sales and related badge. The learning plan is intended to teach technical sellers and Business Partners how to conduct a proof of experience (PoX) for a client.

In a fast-paced world, things change

The products and services may appear differently than what is shown in the lab guide. This can occur if the product or service is updated with a new version.

Responses generated by IBM watsonx Assistant for Z are likely to change over time. The responses you see when you run the queries in this section may differ from the screen images captured in the lab guide.

This lab guide covers the setup, configuration, and usage of watsonx Assistant for Z. This lab guide uses the [IBM watsonx Assistant for Z Velocity collection](#) and the three Velocity Pilot lab environments in IBM Technology Zone (ITZ).

The lab guide also enables dedicated lab environments for customized client PoXs and demonstrations. If you are preparing for an actual pilot engagement, refer to the [Pilot Scoping Guide for watsonx Assistant for Z](#) for additional information.

The lab guide provides the following guidance to:

- Provisioning the lab environments
- Creating an assistant and configuring conversational search
- Configuring assistant settings
- Testing conversational search
- Deploying a dedicated instance of OpenSearch for client document ingestion (Optional)
- Importing skills for z/OS automations
- Connecting apps to assistants
- Creating assistant actions
- Creating skill flows
- Learn about custom-built actions
- Learn about Importing pre-packaged z/OS skills
- Publishing and deploying your assistant

**Not all capabilities of the offering are covered in the lab guide.**

This lab guide covers many features and capabilities of IBM Watson Assistant for Z, but not all. Some uncovered capabilities may be available in ITZ environments, while others may not, such as using skills for OMEGAMON.

Support

Think something is down? Check the applicable status pages for any known issues such as a site or service not being available:

- [IBM Technology Zone status](#)

For issues with provisioning the ITZ environment for this lab (for example, a failed reservation request due to insufficient quota capacity), open a ticket with ITZ support:

- Web: [IBM Technology Zone ticket system](#)
- Email: techzone.help@ibm.com

For issues related to specific steps found in the demonstration guide after the ITZ environment is provisioned, contact the authors:

- Slack:
 - [#watsonx-assistant-z-technical](#) - IBM only
 - [#wxo-practitioners](#) - IBM only - for questions that are related to the software as a service (SaaS) instance of watsonx Orchestrate
- Email: andrewj@us.ibm.com and maxwell.g.weiss@ibm.com

Business Partners, use the IBM Training live Chat Support service or other support methods that are found on the IBM Training portal [here](#).

Using the demonstration guide

Use these helpful tips to take full advantage of the IBM watsonx Assistant for Z for Technical Sales Level 4 Lab Guide.

🖨 Printing the demonstration guide

⚠ Printed or saved copies can be out of date

The IBM watsonx Assistant for Z for Technical Sales Level 4 Lab Guide changes regularly to match the IBM watsonx Assistant for Z offering and associated ITZ environment. Printed or saved copies of the demonstration guide can become out-of-date quickly and result in failed steps.

A ready-to-print PDF version of the IBM watsonx Assistant for Z for Technical Sales Level 4 Lab Guide is [here](#).

🖼 Viewing images

Images in the demonstration guide can be enlarged by clicking on the image. Press the **Esc** key or click the **X** to dismiss the enlarged image.

Reserve the IBM Technology Zone environment

IBM watsonx Assistant for Z for Technical Sales Level 4 Lab Guide

Welcome

Reserve the IBM Technology Zone environment

Pilot setup

Next steps

2. Click **Reserve now**.
The **Reserve now** option creates a reservation for immediate use. Optionally, schedule the reservation for a later date, like when you will be at your client's office.

3. Complete the reservation request and click **Submit**.
The first two reservations will be similar to the first image below and have fields a-e that will need to be completed.

- a. Optionally, change the **Name** field for the reservation.
- b. Select the **Education** purpose tile.
- c. Enter a **Purpose description**.
- d. Select the region nearest your physical location in the **Preferred Geography** drop-down.
- e. The **End date and time** will be set to 2 days after the current date and time.
- f. Accept the IBM Technology Zone's terms and conditions and security policies.
- g. When satisfied with the parameters, click **Submit**.

Image highlighting

In some images, the following styles of highlighting are used:

- **Solid highlight box:** This style of box highlights where to click, enter, or select an item.

- **Dash highlight box:** This style of box highlights one of two things: the path to follow to get to a specific location in the user interface, or areas to explore on your own.

Copying commands and prompts

Copying and pasting commands and prompts from this demonstration guide is easy and can eliminate typographical errors.

Click the highlighted copy icon and then use your operating system's paste function. For example, ^ Ctrl + V or right-click and select Paste .

Prompt 1

What is the APF list in z/OS? Provide a detailed explanation.

Acronyms and terminology

IBM employees and the tech industry in general, tend to use acronyms. In the demonstration guide, most acronyms will appear with a dashed underline. Hover over the acronym to learn its meaning. A question mark (?) icon will first appear and after a second the tool tip with the acronym's meaning is displayed. Try it here: LPAR.

Guidance for delivering a demonstration

Specific guidance for IBM watsonx Assistant for Z and the ITZ environment

Following the scripts provided in the IBM watsonx Assistant for Z for Technical Sales Level 3 Demonstration Guide will help guarantee a successful demonstration. Use these tips to help insure success with IBM watsonx Assistant for Z and the ITZ environment:

- Follow the scripts in the IBM watsonx Assistant for Z for Technical Sales Level 3 Demonstration Guide for the automations and skills to execute as expected.

Table of contents

General demonstration guidance

Specific guidance for IBM watsonx Assistant for Z and the ITZ environment

The Lab Guide table of contents

This **Demonstration Guide** uses a responsive browser-based interface to ensure pages are usable on various devices with different screen sizes. The Demonstration Guide table of contents may be displayed as highlighted in the green dashed box in this image:

The screenshot shows a browser window for the "IBM watsonx Assistant for Z for Technical Sales Level 3 Demonstration Guide". The title bar includes the course name, a refresh icon, and a search bar. The main content area has a green dashed box highlighting the left sidebar, which contains the Table of Contents. The sidebar lists chapters such as "Welcome", "Guidance for delivering a demonstration", "Reserve the IBM Technology Zone environment", "Demonstration scenarios", "Introduction to scenarios", "Scenario 1: Authorized Program Facility", "Scenario 2: Certificate renewal", "Scenario 3: Db2 versioning", "Scenario 4: Initial Program Load on Z", "Additional IBM Z related prompts", "Summary", "Next steps", "Printing the guide", and "Instructions". The main content area displays the "Welcome" page, which introduces the course goal and provides an overview of the content.

However, if the browser window is sized smaller, the table of contents can be accessed by clicking the main menu icon (≡):

The screenshot shows the same browser window after the main menu icon (≡) was clicked. The sidebar is now collapsed, and the main content area displays the "Welcome" page. The main menu icon is highlighted with a green box.

Click the main menu icon (≡) to expand the table of contents.

Continue to the [Reserve the IBM Technology Zone environments](#) section to begin the journey to obtain the IBM watsonx Assistant for Z Technical Sales Advanced badge.

IBM Technology Zone environment

To enable sellers to learn how to deliver client pilots of IBM Watsonx Assistant for Z, three environments are available in IBM Technology Zone (ITZ). The environments are part of the Watsonx Assistant for Z Velocity lab collection and can be found in the [IBM Watsonx Assistant for Z](#) collection.

- **Watsonx Assistant for Z lab – watsonx Orchestrate:** provides a dedicated environment on IBM Cloud where you can create and configure the assistant, set up conversational search, import skills, and configure actions.
- **Ansible Automation Platform (AAP) & z/OS:** provides a pre-configured instance of AAP and Wazi z/OS. This environment includes Ansible playbooks, which you can import as skills within WatsonX Orchestrate and connect to your assistant. Preinstalled templates for various use cases are also available (covered in later sections). Learn more about AAP [here](#). Learn more about Wazi, [here](#).
- **Single Node OpenShift with NFS storage:** provisions a single-node Red Hat OpenShift cluster (SNO) on IBM Cloud. This cluster installs a dedicated instance of [OpenSearch](#) for Watson Assistant for Z, enabling ingestion of client-supplied documents.-

All activities in this lab guide are required.

To earn the IBM Watsonx Assistant for Z Technical Sales Advanced badge and complete the Level 4 learning plan, you must provision all three ITZ environments and finish every section in the lab guide. Disregard any statements in the ITZ collection that suggest optional environments or tasks.

Follow the instructions to create new reservation requests, extend the reservations, and access the ITZ demonstration environments. Provisioning the SNO environment in ITZ can take several hours, while the other two environments typically provisioning in under 30 minutes.

Create a reservation request

1. Click each of the links that follow to open a browser to the reservation pages of the **IBM Watsonx Assistant for Z** ITZ environments.

You may be asked to authenticate to IBM Technology Zone.

The steps to authenticate to ITZ are not detailed here as they may vary between users.

[Watsonx Assistant for Z lab – watsonx Orchestrate - reservation page](#)

[Ansible Automation Platform \(AAP\) & z/OS - reservation page](#)

[Single Node OpenShift with NFS storage - reservation page](#)

The next two steps are for one of the three environments. Repeat for all three environments.

Follow the steps to create a reservation in ITZ for all three environments.

2. Select **Reserve now**.

The **Reserve now** option creates a reservation for immediate use. Optionally, schedule the reservation for a later date, for example, when you are at your client's office to start a pilot.

The screenshot shows the 'Create a reservation' interface. At the top, there are tabs for 'IBM Technology Zone', 'My TechZone', and 'Help'. On the right, there are search, filter, and collection management buttons. The main area has four tabs: 'Select an environment/infrastructure', 'Select a reservation type', 'Fill out your reservation', and 'Complete'. Below these tabs, a note says 'Select your reservation type. Do you need this now or later?'. Under 'Single environment reservation options', there are two radio buttons: 'Reserve now' (selected) and 'Schedule for later'.

3. Complete the reservation request form and then click **Submit**.

The first two reservations are similar to the first image and have fields **a-e** that need to be completed.

- a.** Name: specify a name for the reservation (optional).
- b.** Purpose: select the **Education** purpose tile.

For client pilots...

For client pilots, set the **Purpose** field in the reservation to **Pilot** and provide an opportunity number to receive a longer reservation.

- c.** Purpose description: enter a description, for example: Level 4 education.
- d.** Preferred geography: select the region nearest to your physical location for improved performance and reduced network latency.
- e.** End date and time: the initial maximum will be set to two days after the current date and time. Instructions follow to extend the reservation end date.
- f.** Accept the IBM Technology Zone's terms and conditions and security policies.
- g.** Click **Submit**.

m I agree to IBM Technology Zone's [Terms & Conditions](#) and [End User Security Policies](#)

n Submit

During the provisioning process, multiple emails are sent to you from ITZ as the provisioning process runs. One email states the reservation is provisioning and the other email states that the environment is **Ready**.

In rare cases, the provisioning process may fail. If you receive an email stating the reservation failed, try again by repeating Steps 1-3 for the environment that failed to provision. In addition, review the [Troubleshooting](#) section that follows. If issues continue, open an [ITZ support ticket](#) by using the methods that are mentioned in the [Support](#) section.

Extend the reservation

When the reservations are in the **Ready** state, you can extend each reservation beyond its original end date. The duration of the extension will vary by reservation.

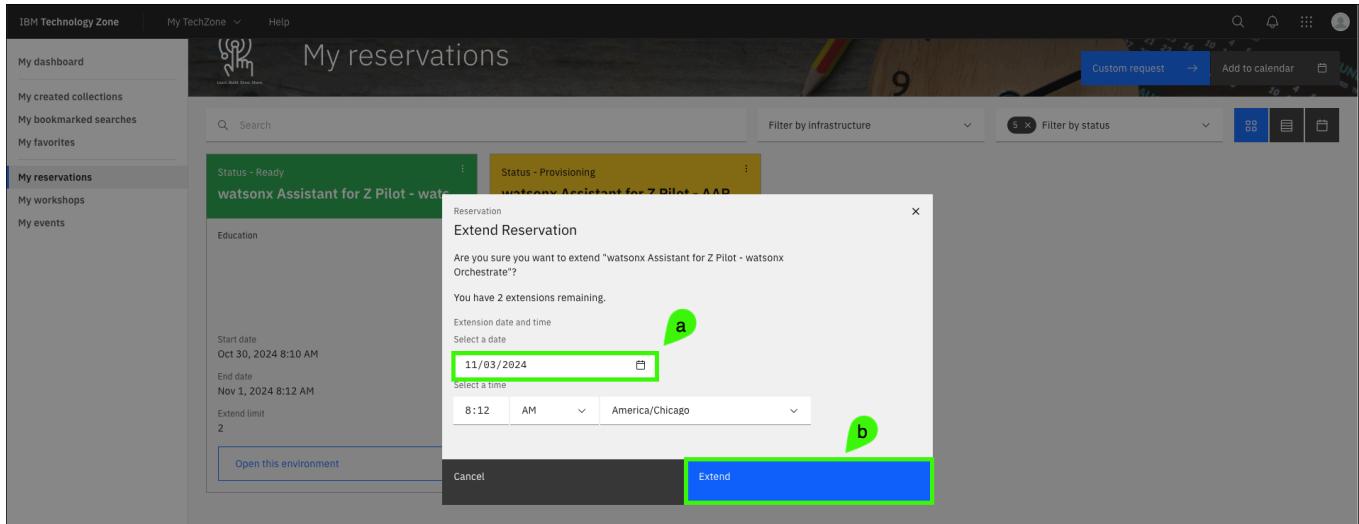

1. In the IBM Technology Zone portal, expand **My TechZone** and select **My Reservations**.

The screenshot shows the IBM Technology Zone portal interface. The top navigation bar includes 'IBM Technology Zone', 'My TechZone ▾', 'Help', and a search bar. The left sidebar has links for 'My dashboard', 'My created collections', 'My bookmarked searches', 'My favorites', **My reservations** (which is selected), 'My workshops', and 'My events'. The main content area displays a welcome message and a graphic of interconnected nodes. Below this is a section titled 'Certified Base Images' with a sub-section 'Best starting point to build' and a note about TechZone Certified images. The 'My reservations' section lists two items: one for 'watsonx Assistant' (Status: Ready) and another for 'watsonx Assistant for Z Pilot - AAP...' (Status: Provisioning). Each item has a detailed view button, a three-dot overflow menu, and a 'Transfer' or 'Re-reserve' button.

2. Click the **overflow icon (⋮)** on the reservation tile and select **Extend**.

This screenshot shows the 'My reservations' page with two entries. The first entry for 'watsonx Assistant' has its overflow menu open, and the 'Extend' option is highlighted with a dashed green box. The second entry for 'watsonx Assistant for Z Pilot - AAP...' also has its overflow menu open. Both entries show their current status, start and end dates, and the ability to transfer or re-reserve. At the bottom of the page, there are buttons for 'Open this environment' and a refresh icon.

3. Click the **Select a date** option, (a) specify the date to extend to, and then (b) click **Extend**.

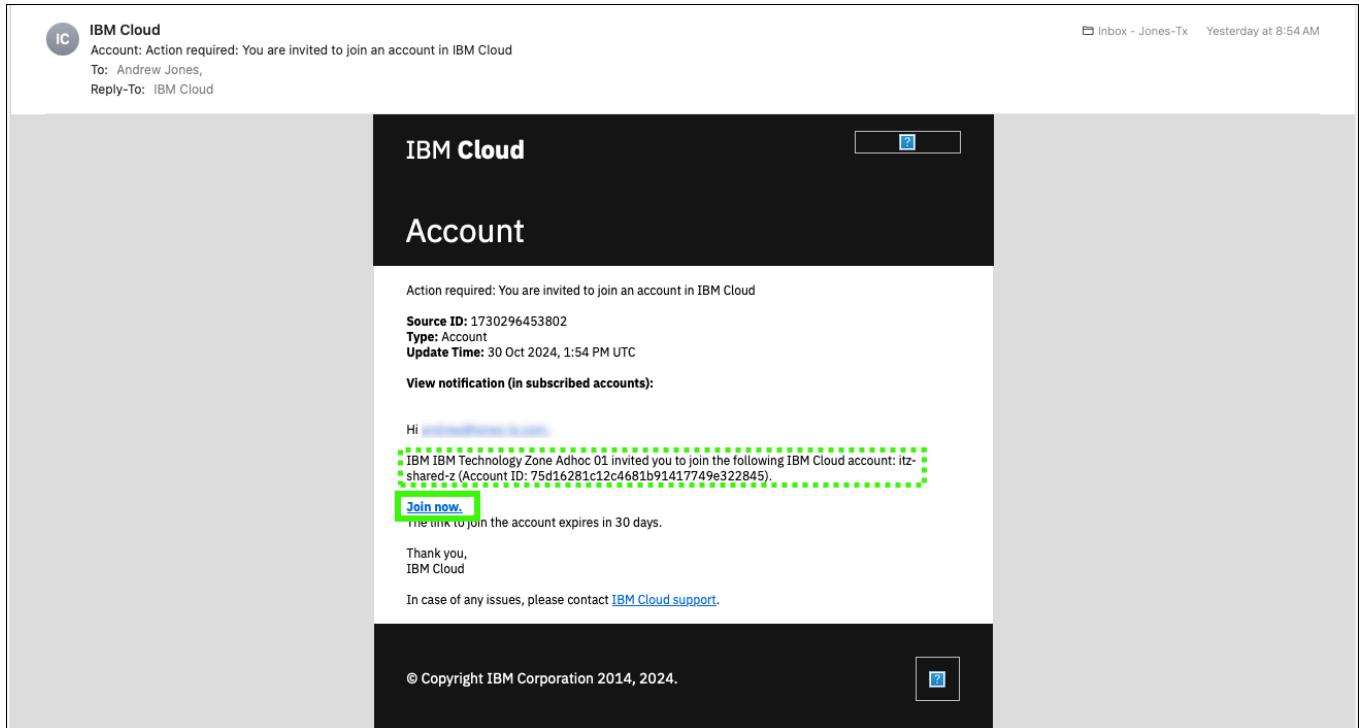

If you anticipate needing more time, repeat Steps 5-6 to extend the reservation to the maximum allowed. Repeat these steps for the other two reservations.

Join the ITZ IBM Cloud account

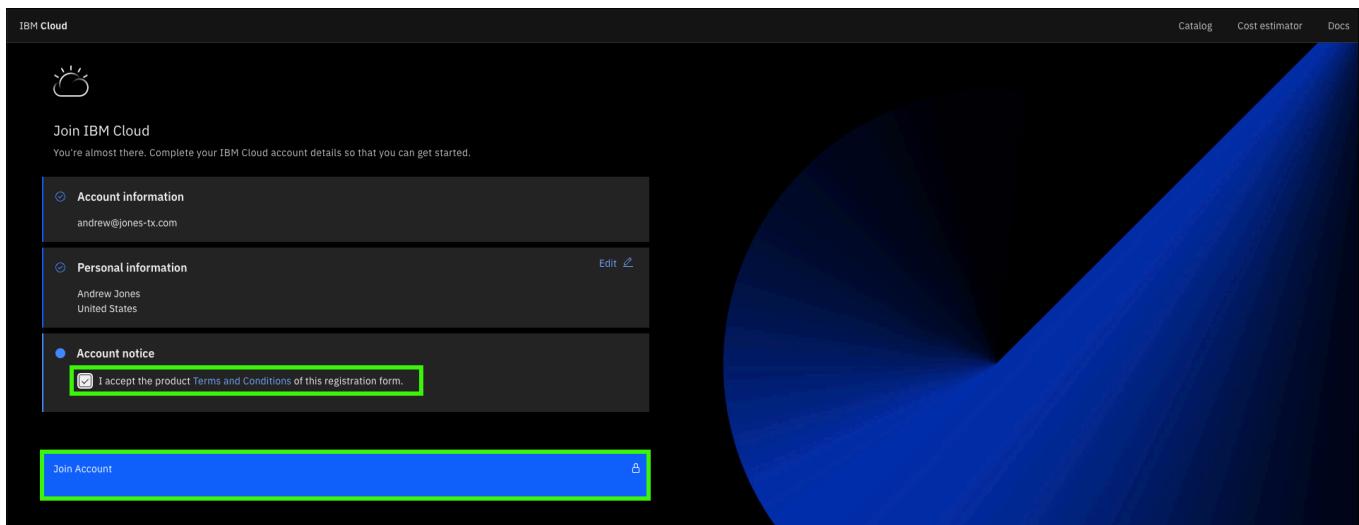

Both the **watsonx Assistant for Z lab – watsonx Orchestrate** and the **Ansible Automation Platform (AAP) & z/OS** environments add you to an IBM Cloud account while your reservation is active. During the provisioning process of these ITZ environments, you receive two emails from IBM Cloud.

You only need to accept the invitation to the **watsonx Assistant for Z lab – watsonx Orchestrate** environment.

1. Open the email from **IBM Cloud** and click the **Join now** links.

2. In the **Join IBM Cloud** browser window that opens, select the **I accept the product Terms and Conditions** of the registration form, and then click **Join Account**.

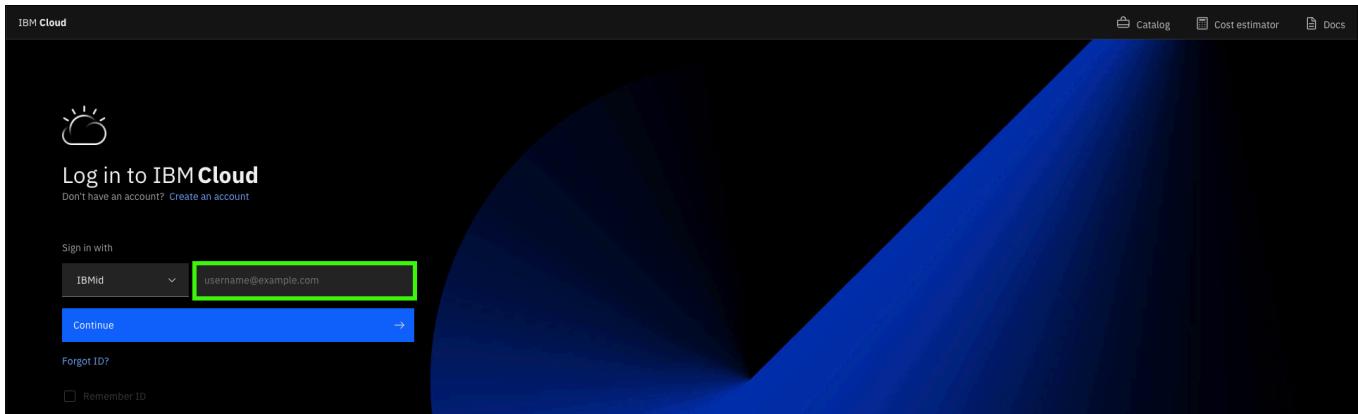

After joining the account, verify that the account appears in your available account list in the IBM Cloud portal.

- Click the following link to open a browser to the IBM Cloud portal.

IBM Cloud portal

- Follow the directions to complete the authentication to IBM Cloud using the same email address you used to login to ITZ. The login steps vary depending on any two-factor authentication methods enabled.

- Click the **account** menu and verify access to the IBM Cloud account listed in your ITZ reservation.

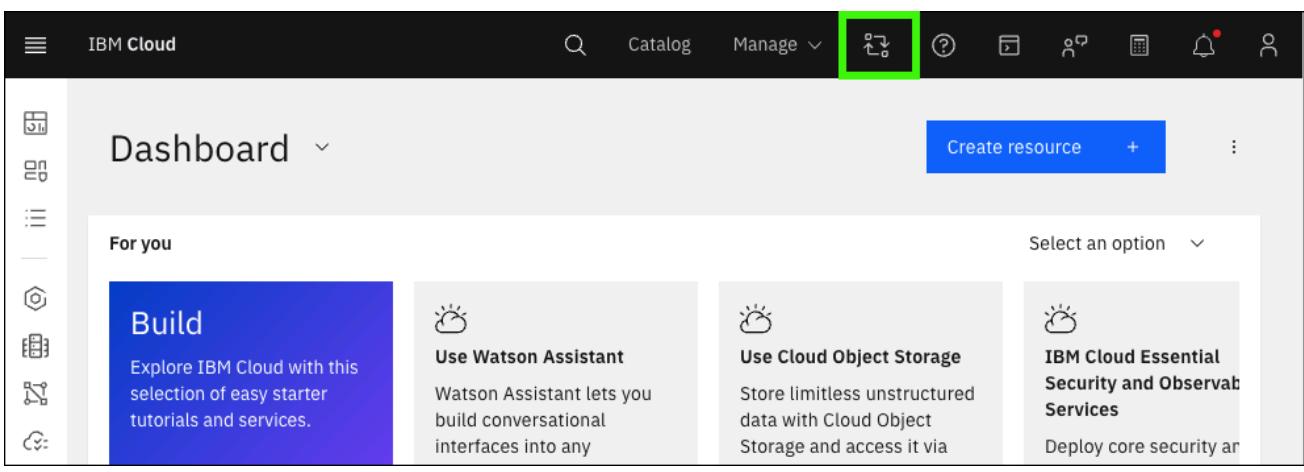

The account may change within ITZ.

Over time, the account may change for the environments. The account names should align with the account named in the invitation email you received.

 Does your IBM Cloud portal view look different?

If your IBM Cloud portal looks different from the images above, it could be because the IBM Cloud portal has gone through a design change, or your browser window is set to smaller size. Instead of the current selected account appearing in the top menu, you may see this **change account** icon:  Click this icon to view the list of accounts you can access.

Accessing the environments

Each reservation provides access to its respective environment. Details for accessing each environment are provided in the **Pilot setup** sections that follow in the lab guide.

After all three reservations are in the **Ready** state and you accept the invitations to the IBM Cloud accounts, proceed to the next section to complete the pilot setup.

Troubleshooting

 If your reservation for the Single Node OpenShift environment fails...

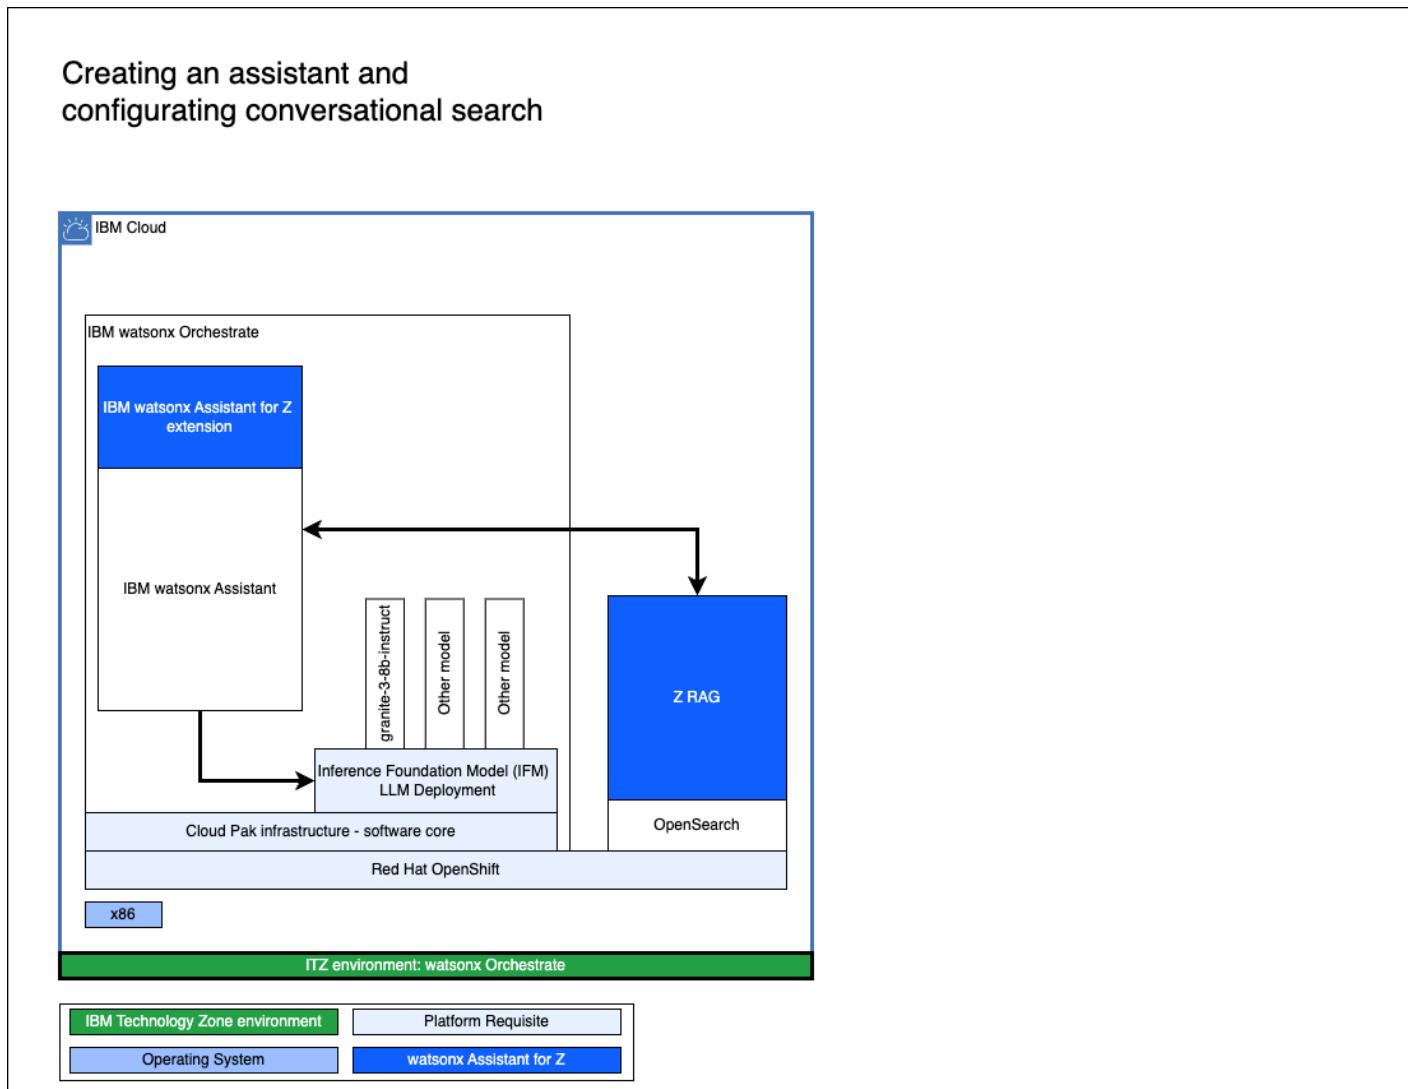

If your reservation for the Single Node OpenShift environment fails, try selecting one of the **eu-gb region** options as the **Preferred Geography**.

Pilot setup

Creating an assistant and configuring conversational search

Watsonx Orchestrate enables you to create and configure an assistant with conversational search capabilities. Configure your assistant to use conversational search by leveraging a hosted OpenSearch instance. The pre-configured instance of Watsonx Orchestrate in IBM Technology Zone (ITZ) boasts over 220 knowledge sources and supports Retrieval Augmented Generation (RAG). The large language model (LLM) providing conversational AI augments this knowledge based on IBM Z documentation, generating IBM Z context-aware responses to queries with content-grounded knowledge.

Below is a high-level, logical architecture of the environment you will deploy in this section.

Access the ITZ IBM Cloud account for the Watsonx Assistant for Z Pilot environment

1. In the IBM Technology Zone portal, expand **My TechZone** and select **My Reservations**, or click the following link.

Steps to authenticate to IBM Cloud are not illustrated here.

You may need to authenticate to IBM Cloud after clicking the link. These steps are not shown here as they may vary by individual.

- Verify that the current IBM Cloud account is the same as the account name recorded in step 3. If the account is not the same, switch to the proper account.

Note: The formatting of the name can appear differently than what is shown in the ITZ reservation.

Resource list

Name	Group	Location	Product	Status	Tags
Filter by name or IP address...	Filter by group or org...	Filter...	Filter...	Filter...	Filter...
Compute (0)					
Containers (0)					
Networking (0)					
Storage (0)					
Converged infrastructure (0)					
Enterprise applications (0)					
AI / Machine Learning (1+)					
Analytics (0)					

If the proper account is not listed, click the account drop down and select the proper account.

Note: If your browser window is narrow, the account drop down can be depicted with the Switch Account icon ().

The screenshot shows the IBM Cloud Resource list interface. At the top, there's a search bar labeled "Search resources and products..." and several navigation buttons: Catalog, Manage, and a user icon. Below the search bar is a large search input field with a dropdown menu. To the right of the search field is a "Create resource" button. On the left, there's a sidebar with icons for Compute, Containers, Networking, Storage, and Converged infrastructure. The main area displays a table with columns: Name, Group, Location, Product, Status, and Tags. A row in the table is highlighted with a green box, showing the value "2953593 - itz-watsonx-036".

Create your Assistant

1. Click the **Resources** icon (☰).

The screenshot shows the IBM Cloud Dashboard. On the left, there's a sidebar with icons for Build, Watson Assistant, Cloud Object Storage, Maximo Application Suite, Build with Watson, Watson Studio, and Get Started with Studio. The "Build" section is highlighted with a green box. The main area shows a grid of cards under the heading "For you". One card for "Build" is highlighted with a green box. The dashboard also features a search bar at the top and a "Create resource" button on the right.

2. Expand the **AI / Machine Learning** section and click the **watsonx Orchestrate** instance listed (the instance name is different than shown in the following image).

The screenshot shows the IBM Cloud Resource list interface. The sidebar on the left has a green box around the "Enterprise applications" icon. Under "Enterprise applications", the "AI / Machine Learning" section is expanded, indicated by a green box around its title. A specific instance in this section is highlighted with a green box, showing the details: Name "itzwxo-2700039nft-erspw", Group "watsonx-orchestrate-erspw", Location "Dallas", Product "watsonx Orchestrate", Status "Active", and Tags "-".

3. Click **Launch watsonx Orchestrate**.

4. Click the AI assistant builder tile to start creating a new assistant.

5. Enter a name and optional description for your assistant and click **Next**.

6. Complete the **Personalize your assistant** form and click **Next**.

Explore the personalization options. In creating an assistant for a client pilot, consider specifying attributes that align with the client's business.

- Select **Web**.
- Select the industry of your choice.
- Select the role of your choice.
- Select the need of your choice.

8. Preview your assistant and then click **Create**.

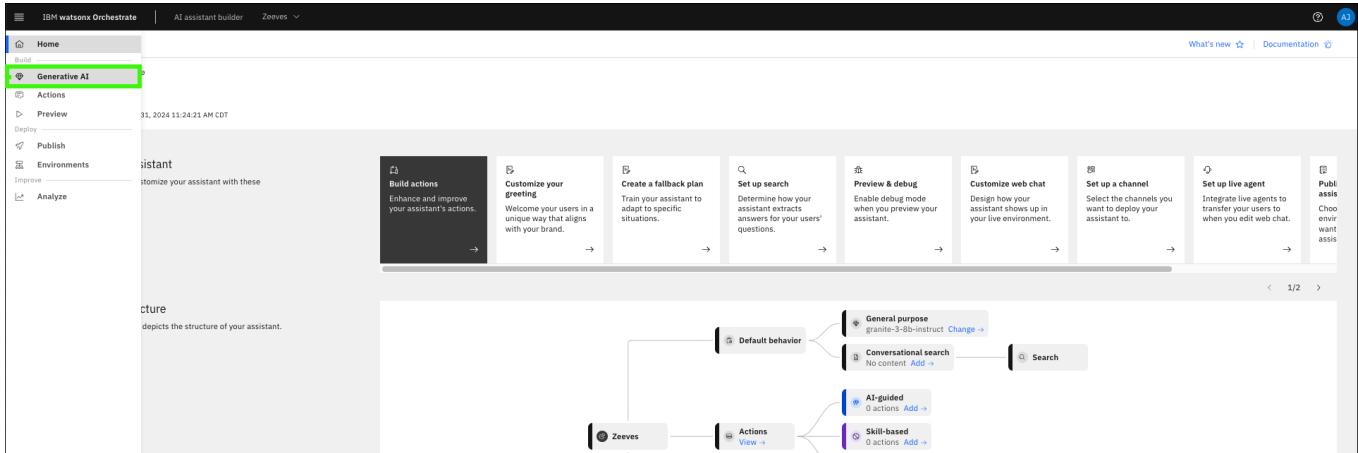

The assistant is now created.

Configure conversational search

In the next steps you will be to configure **conversational search** for your assistant that uses a hosted instance of OpenSearch.

1. Click **Generative AI** menu item (💡) in the left navigation.

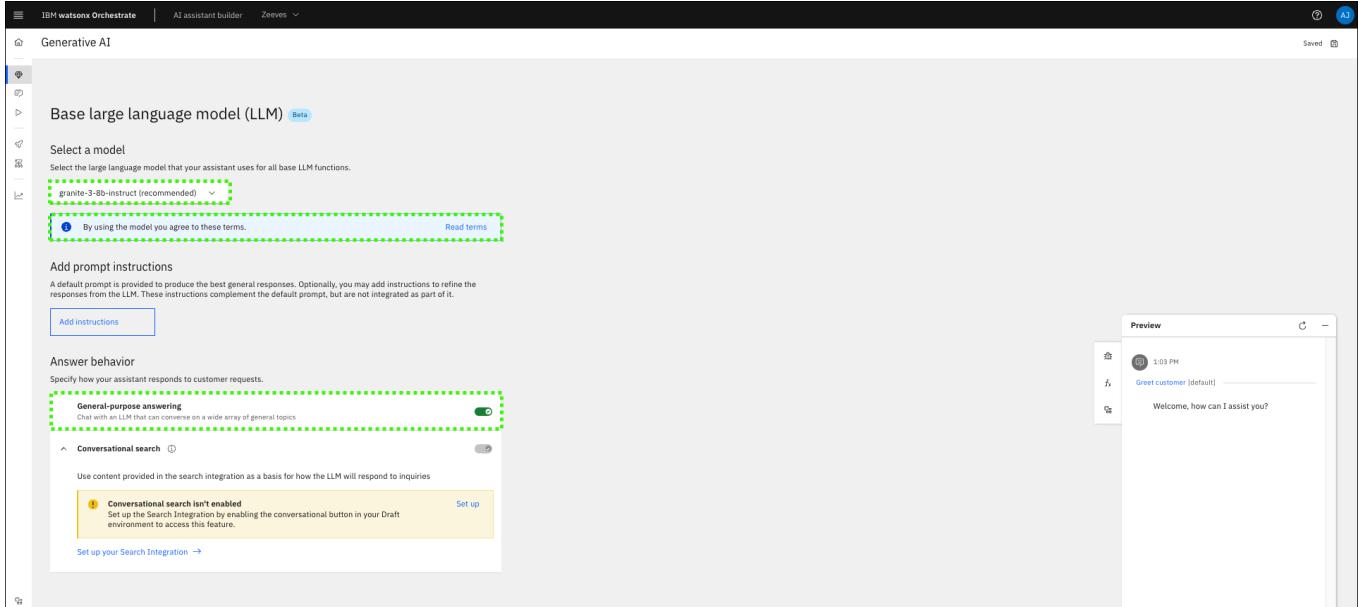

2. Select the base large language model (LLM) settings.

If available, set the LLM model to **granite-13b-chat-v2**.

Notice there are several LLM models available. **The current recommendation is for pilots, to use the *granite-13b-chat-v2* model as it provides the best results in recent testing.** However, this model has been deprecated as of 2024-11-04 and will may not be available after 2025-01-19. **Note:** screen captures that follow show the ***granite-3-8b-instruct*** LLM as being selected.

3. Click Set up your Search Integration.

By default, conversational search is not enabled when an assistant is created. Conversational search takes priority over general-purpose answering if both are enabled. Learn more about conversational search in watsonx [here](#).

4. Click Custom service.

5. Complete the **Custom service (a-e)** form and then click **Next (f)**.

a. Select **By providing credentials**.

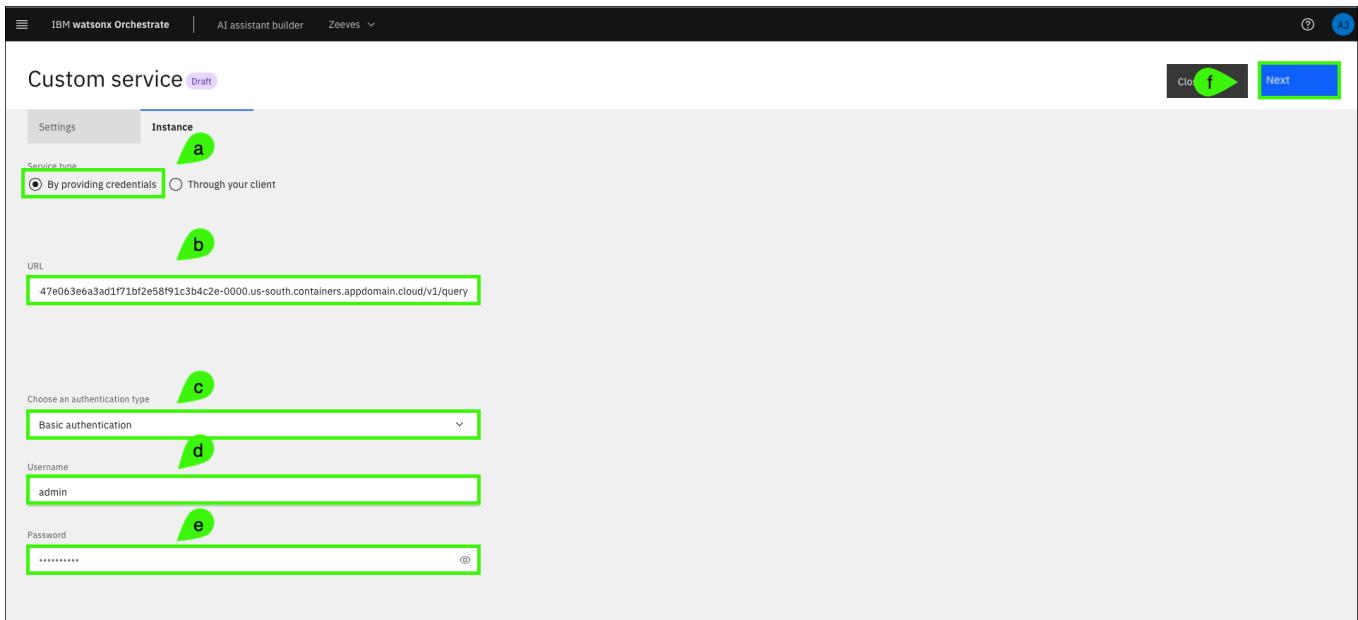

b. Enter the following value in the **URL** field (use the copy icon to avoid typographical errors). This is the **URL** for the a shared **OpenSearch** instance. In later sections you will created and customize a dedicated instance.

```
https://wxa4z-opensearch-wrapper-wxa4z-demo-v2-1-0.wxo4z-opc-opensearch-clus-47e063e6a3ad1f71bf2e58f91c3b4c2e-0000.us-south.containers.appdomain.cloud/v1/query
```

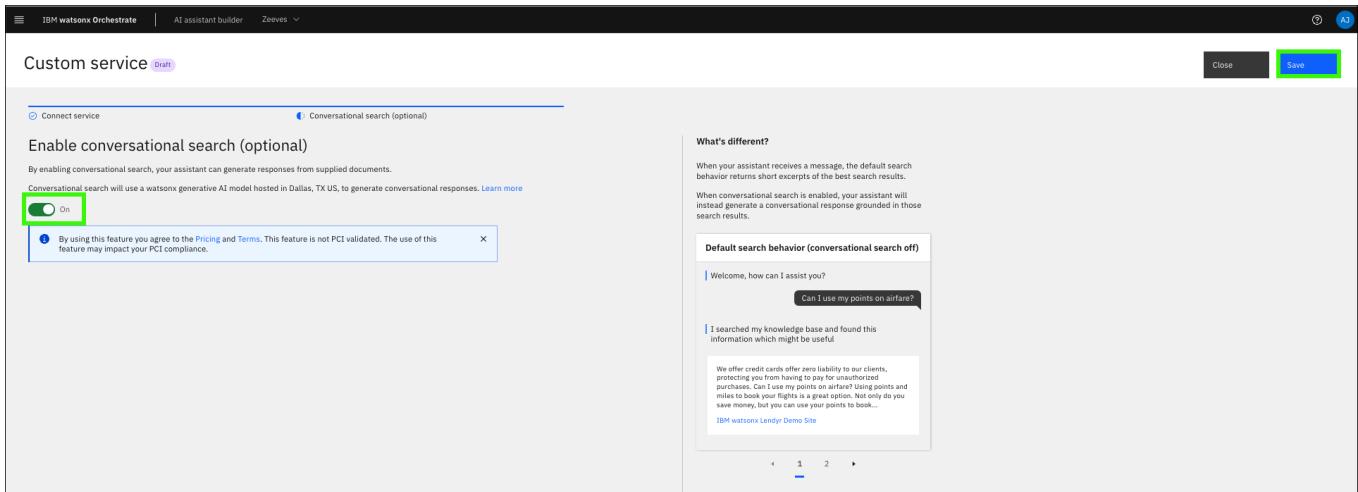

c. Select **Basic authentication** in the **Choose an authentication type** drop-down list.

d. Enter **admin** in the **Username** field.

e. Enter **secureP@ssw0rd!** in the **Password** field.

6. Enable conversational search and then click Save.

7. Update the conversational search **custom service** settings based on your requirements.

Note: The **Settings** page is divided into two sections in the following images to enhance the visibility of the screen captures.

Learn more about these **custom service** settings [here](#).

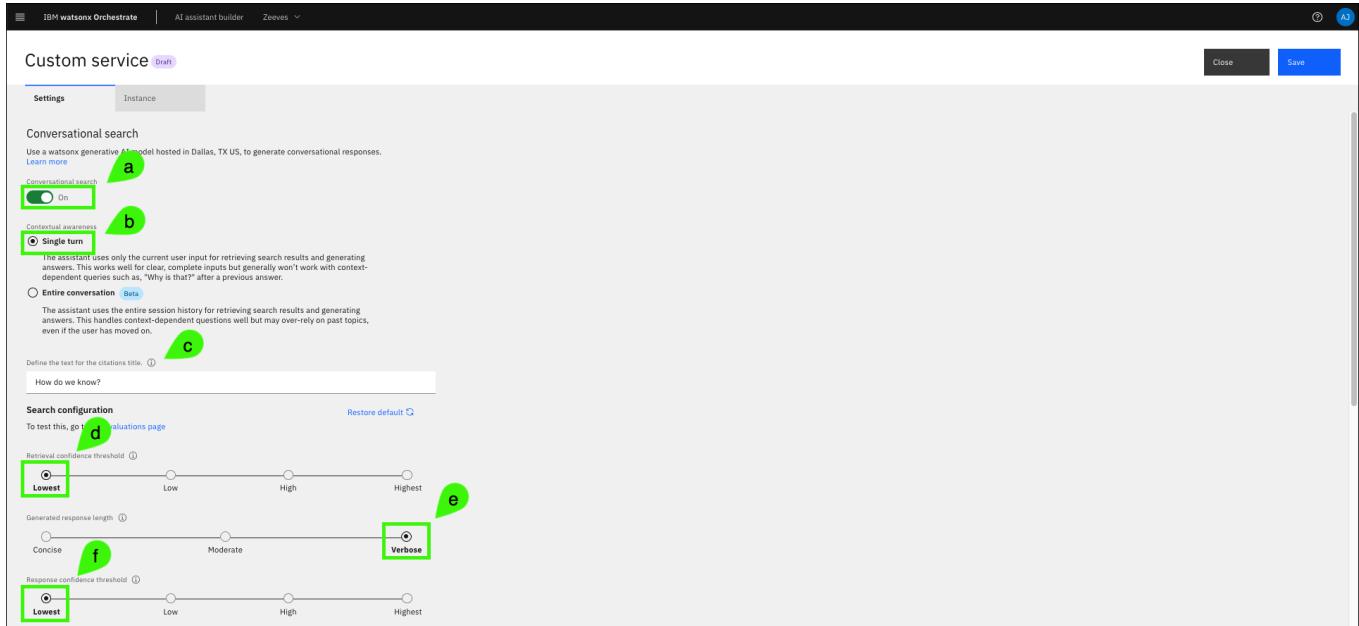

The following settings are proven to work well. You can experiment with these settings to see how they affect queries for your client's pilot.

- a. Enable **Conversational search**.
- b. Select **Single turn. Multi-turn conversation** (by selecting **Entire conversation**) is supported by the offering, but has not been fully included in the lab guide. See the callout in the [Testing conversational search](#) section below.
- c. Specify the text that appears to instruct the user to expand the list of citations in the assistant (except web chat client).
- d. Select **Lowest** for the **retrieval confidence threshold** setting. This setting checks the confidence of the retrieved citations before a response is generated.

e. Select **Verbose** for the **generated response length**. This setting affects the average response length.

Depending on user input, variations from the selected length can occur.

f. Select **Lowest** for the **response confidence threshold**. This setting checks the confidence of the generated citations after the response is generated.

g. Keep the default setting of **All** for the listing of citations.

h. Keep the **Default filter** field empty.

i. The **Metadata** field provides a way to adjust your assistant's behavior during conversational search for your OpenSearch instance. This option is explored in detail in the [Installing and using zassist to ingest client documents](#). Leave the field empty for now.

j. The **Search display text** options specify the default text displayed when no results are found or when connectivity issues to the backend search service occur. You can keep the defaults or customize the service.

8. Click **Save** (a) and then click **Close** (b).

Custom service Draft

Settings **Instance**

Conversational search

Use a watsonx generative AI model hosted in Dallas, TX US, to generate conversational responses. [Learn more](#)

Conversational search On

Contextual awareness

Single turn
The assistant uses only the current user input for retrieving search results and generating answers. This works well for clear, complete inputs but generally won't work with context-dependent queries such as, "Why is that?" after a previous answer.

Entire conversation Beta
The assistant uses the entire session history for retrieving search results and generating answers. This handles context-dependent questions well but may over-rely on past topics, even if the user has moved on.

Define the text for the citations title. (?)

How do we know?

Search configuration Restore default

To test this, go to the [evaluations page](#)

Complete the configuration

After you save and close the **Conversational search** configuration page, a few more configurations are needed to get the best experience from your conversational chat. Details on these settings are available [here](#).

1. Hover over the **Generative AI** icon () in the left navigation and click **Actions**.

Home

Create your first action

With actions, you can help your customers accomplish their goals.

Create action +

3. Click No matches.

The screenshot shows the 'Actions' section of the AI assistant builder. A table lists various actions with their names, last edit times, example counts, and statuses. The 'No matches' action is highlighted with a green box around its row.

Name	Last edited	Examples Count	Status
Greet customer	3 hours ago	1	Green
Trigger word detected	3 hours ago	1	Green
No matches	3 hours ago	1	Green
Fallback	3 hours ago	1	Green

4. Click Step 1 under Conversation steps.

The screenshot shows the 'Conversation steps' section for the 'No matches' action. It displays two steps: Step 1 and Step 2. Step 1 is highlighted with a green box. The 'Action starts' section indicates that no action can be matched to the customer's message, and it includes a tip about using a default retry message or customizing it.

5. Select without conditions (a) in the Is taken drop-down menu and then click Clear conditions (b).

Note: the Is taken value does not change from with conditions after selecting without conditions.

The screenshot shows the configuration of Step 1. The 'Is taken' dropdown is currently set to 'with conditions'. A modal dialog titled 'Clear conditions?' is open, asking if the user wants to proceed. The 'Clear conditions' button in the dialog is highlighted with a red box.

6. Delete the default text in the Assistant says entry field.

The screenshot shows the configuration of Step 1. The 'Is taken' dropdown has been changed to 'without conditions'. The 'Assistant says' field is highlighted with a green box. The field contains placeholder text: '| or example: Please select from the following options:'.

7. Expand the And then drop-down menu and select Search for the answer.

The screenshot shows the AI assistant builder interface with the 'Editor' tab selected. In the 'Step 1' section, the 'Is taken' dropdown is set to 'without conditions'. The 'Assistant says' field contains a message template: 'For example: Please select from the following options:' followed by a list of icons. Below this is a 'Define customer response' section. The 'And then' section is expanded, showing a list of actions. The 'End the action' option is highlighted with a green border.

8. Click Edit settings.

The screenshot shows the AI assistant builder interface with the 'Editor' tab selected. In the 'Step 1' section, the 'Is taken' dropdown is set to 'without conditions'. The 'Assistant says' field contains a message template: 'For example: Please select from the following options:' followed by a list of icons. Below this is a 'Define customer response' section. The 'And then' section is expanded, showing a list of actions. The 'Search for the answer' option is highlighted with a green border. A modal dialog titled 'Edit settings' is open over the interface, specifically for the 'Search for the answer' action. The dialog shows settings for 'Custom query' (None) and 'Custom filter' (None Optional). The 'Edit settings' button in the dialog is also highlighted with a green border.

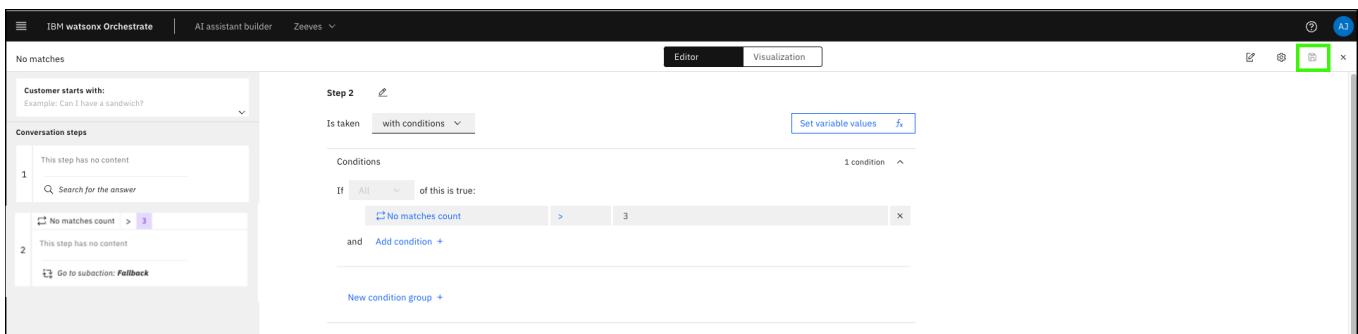

9. Click After generation.

The screenshot shows the AI assistant builder interface with the 'Editor' tab selected. A modal dialog titled 'Settings' is open over the interface, specifically for the 'Search for the answer' action. The dialog is titled 'Search configuration' and has a sub-tab 'After generation' selected. It contains fields for 'Custom search query (Optional)' (Example: Which accounts have fees?) and 'Custom results filter' (radio button options: 'Use default' (selected) and 'Set new filter' (Example: enriched_text.entities.text.:Boston, MA)). At the bottom of the dialog are 'Cancel' and 'Apply' buttons, with 'Apply' being highlighted with a blue background.

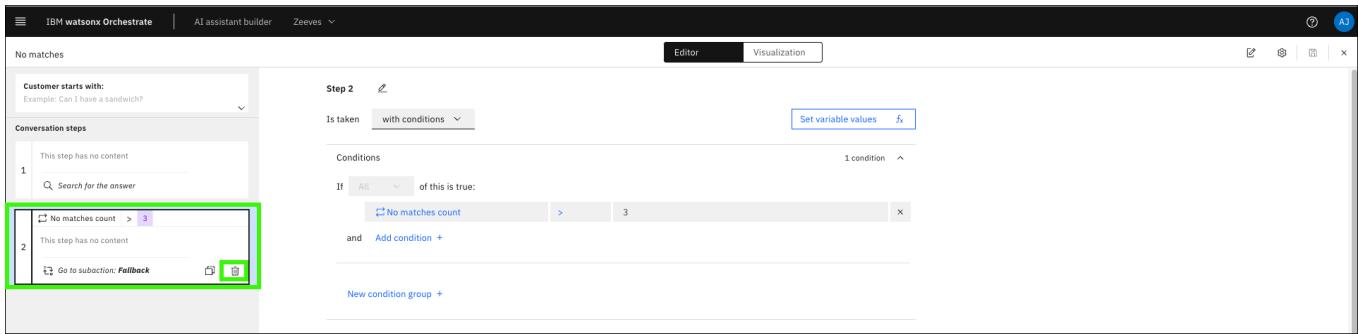

10. Select End the action after this step and then click Apply.

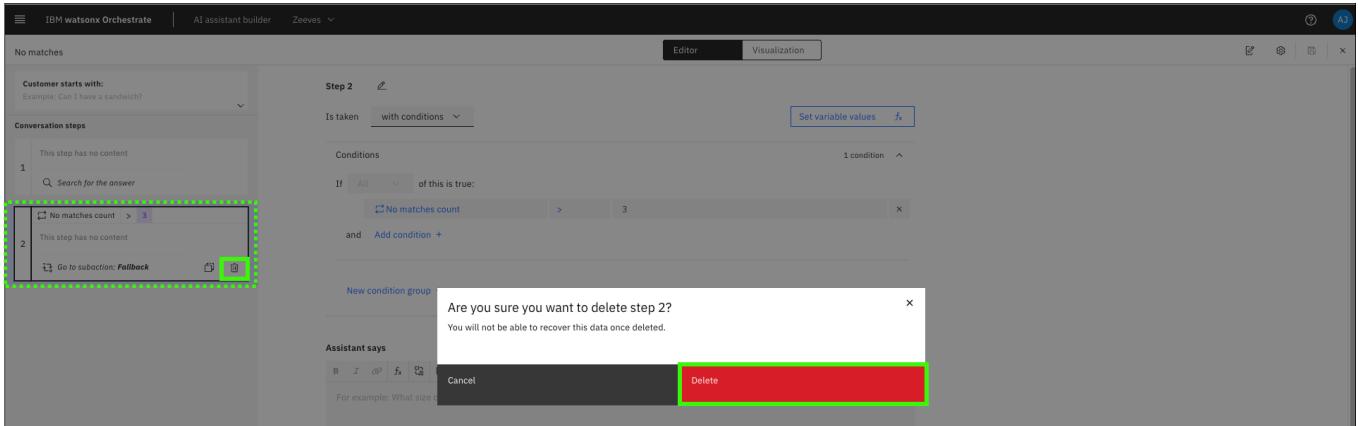

11. Click Save (💾).

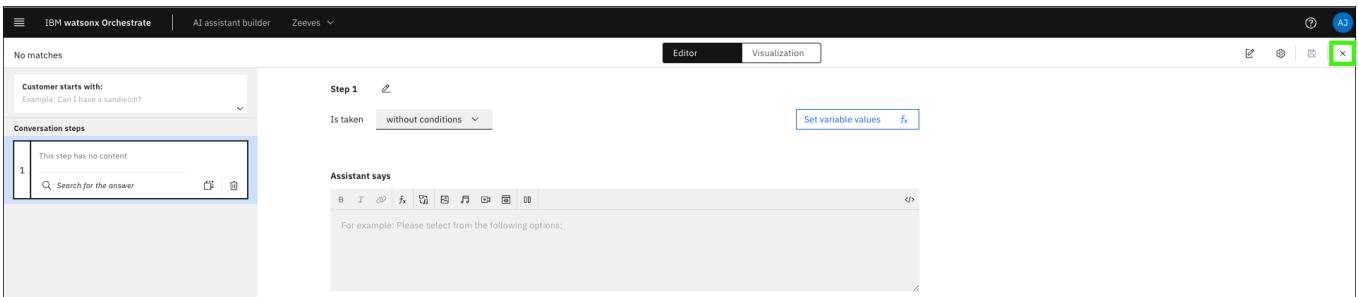

12. Select Step 2 (No matches count) under Conversation steps and click delete (🗑).

13. Click Delete in the confirmation dialog to delete Conversation step 2.

14. Click **Close** (the x icon) the **Editor** window.

15. Click **Fallback** in the **Actions** table.

Actions				
	Name	Last edited	Examples Count	Status
All items	Greet customer	3 hours ago	0	Green
Created by you	Trigger word detected	3 hours ago	0	Green
Set by assistant	No matches	a minute ago	0	Green

No matches

Your assistant can show options to users when multiple actions seem to match what the customer wants. [Learn more about asking a clarifying question](#)

Enable disambiguation On

Assistant says
Introduction text before listing the options.
Did you mean:

No matches
Option for when the user doesn't see relevant options. Leave blank to omit.
None of the above

Beta Response modes
 Off

One action matches
Option for when user doesn't want to start the matched action
Something else

Connection to support
Can be any alternative help, such as a live agent or contact information
Connect to support

Example of asking a clarifying question

Important Make sure your action names are short and clear to your customers. Action names will appear in the list of choices.

Bank Bot

open an account

Did you mean:

- Open a new savings account
- Open a new checking account
- I want to apply for a mortgage loan
- None of the above

20. Move the slider to **More often** (or select **More often** in the drop-down).

The setting helps ensure that actions are triggered less often unless the user's query specifically matches the action's input.

Global settings

Conversation routing Change conversation topic Generative AI **New!** Autocorrection Display formats Algorithm Version Upload/Download

No matches

Unrecognized input by customers triggers the **No matches** action that can be configured to fetch answers from a [search integration](#) or trigger the **Fallback** action.

By setting this threshold, you can affect how often your assistant routes customers to the "No matches" action.

Use "No matches" More often

21. Click **Autocorrection**.

Global settings

Conversation routing Change conversation topic Generative AI **New!** **Autocorrection** Display formats Algorithm Version Upload/Download

No matches

Unrecognized input by customers triggers the **No matches** action that can be configured to fetch answers from a [search integration](#) or trigger the **Fallback** action.

By setting this threshold, you can affect how often your assistant routes customers to the "No matches" action.

Use "No matches" More often

22. Click the autocorrection toggle to turn the feature **Off**.

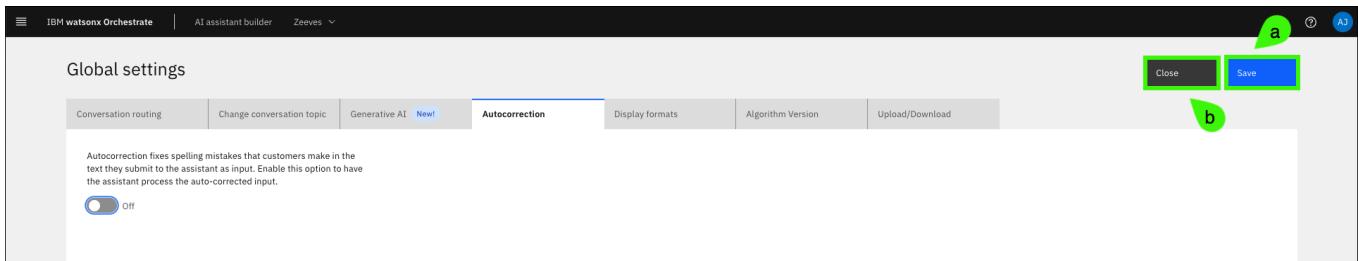

Global settings

Conversation routing Change conversation topic Generative AI **New!** **Autocorrection** Display formats Algorithm Version Upload/Download

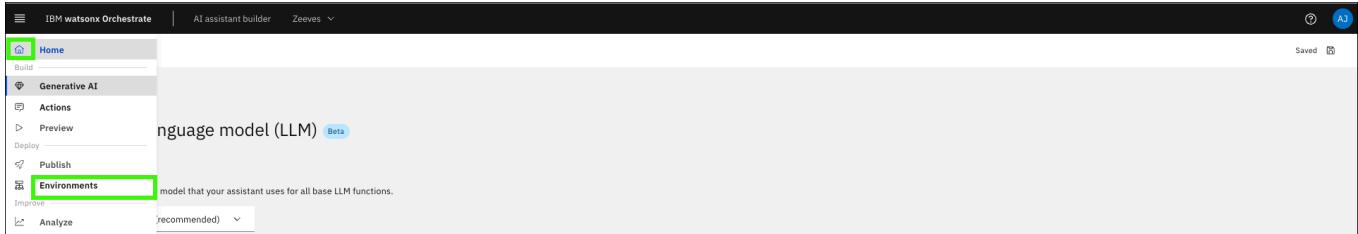

Autocorrection fixes spelling mistakes that customers make in the text they submit to the assistant as input. Enable this option to have the assistant process the auto-corrected input.

Off

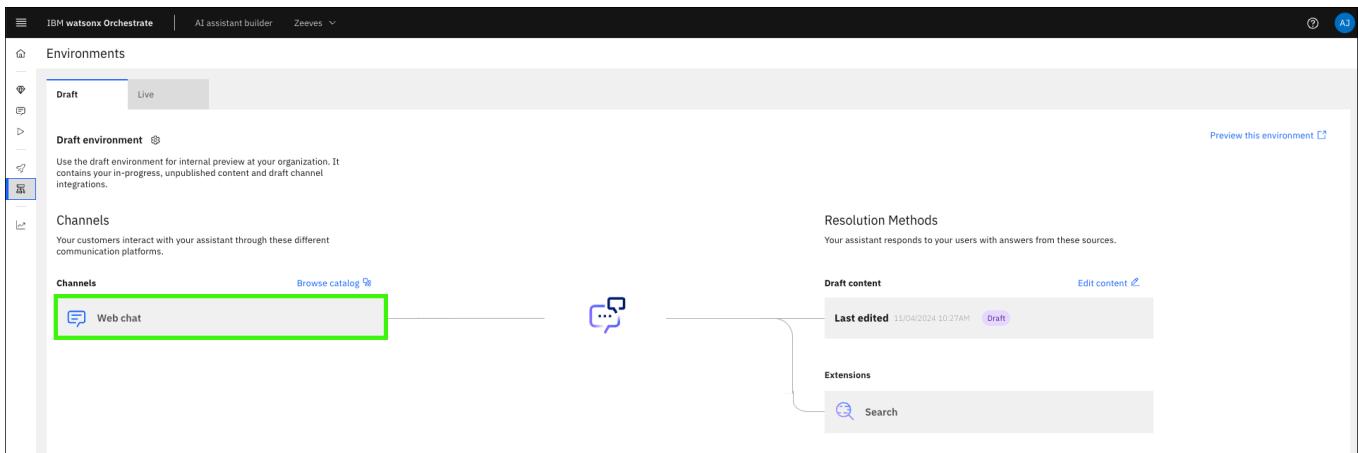

23. Click **Save** (a) and then **Close** (b).

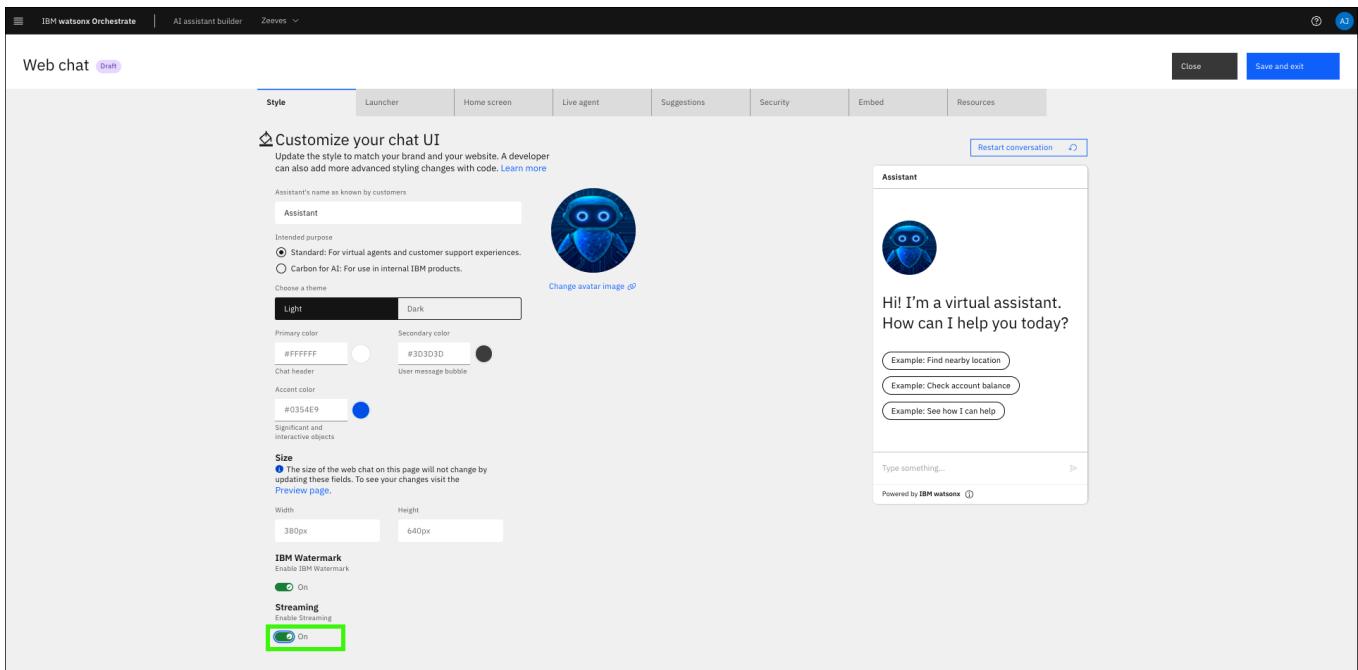

24. Hover over the Home (🏠) and click Environments.

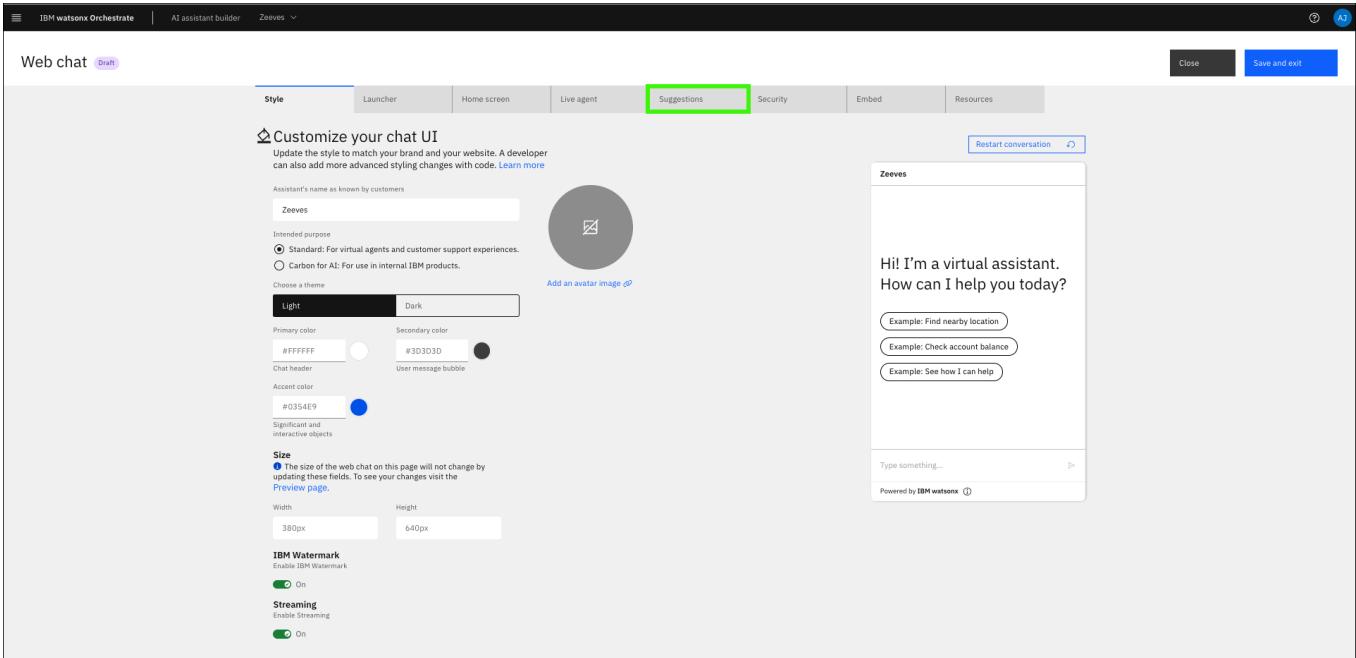

25. Click Web chat.

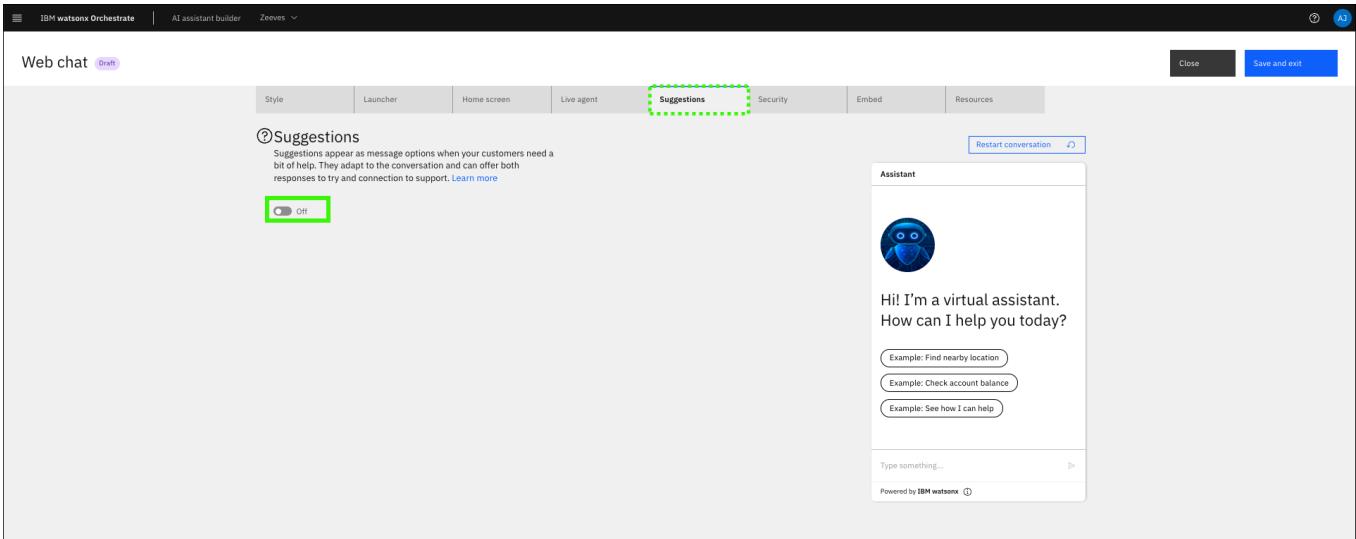

26. On the Style tab, click the Streaming toggle to enable streaming.

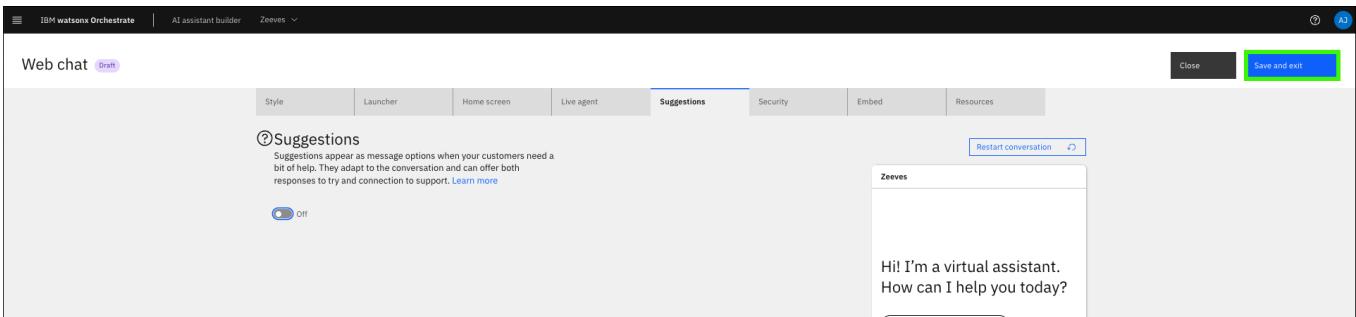

27. Click **Suggestions**.

28. Click the **Suggestions** toggle to turn this feature Off.

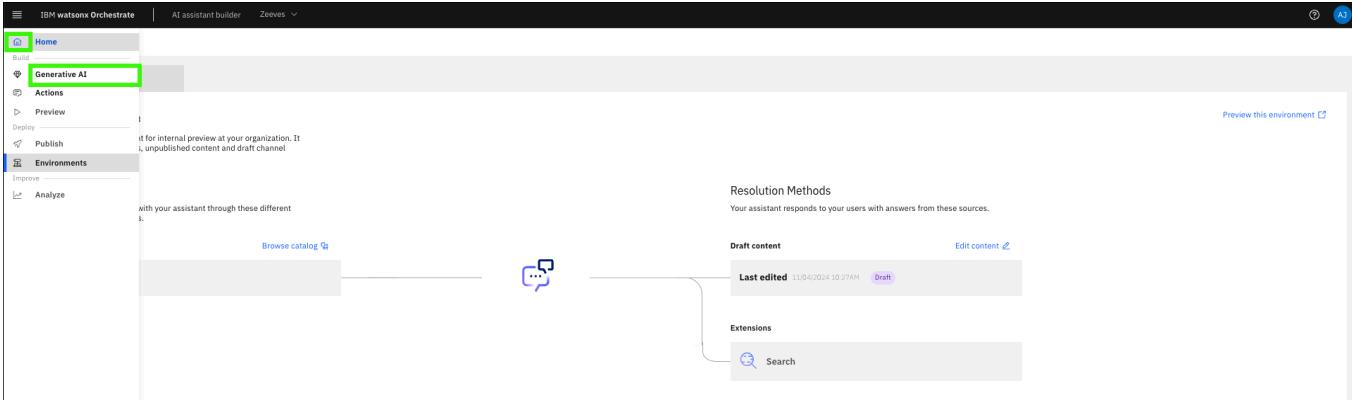

29. Click **Save and exit**.

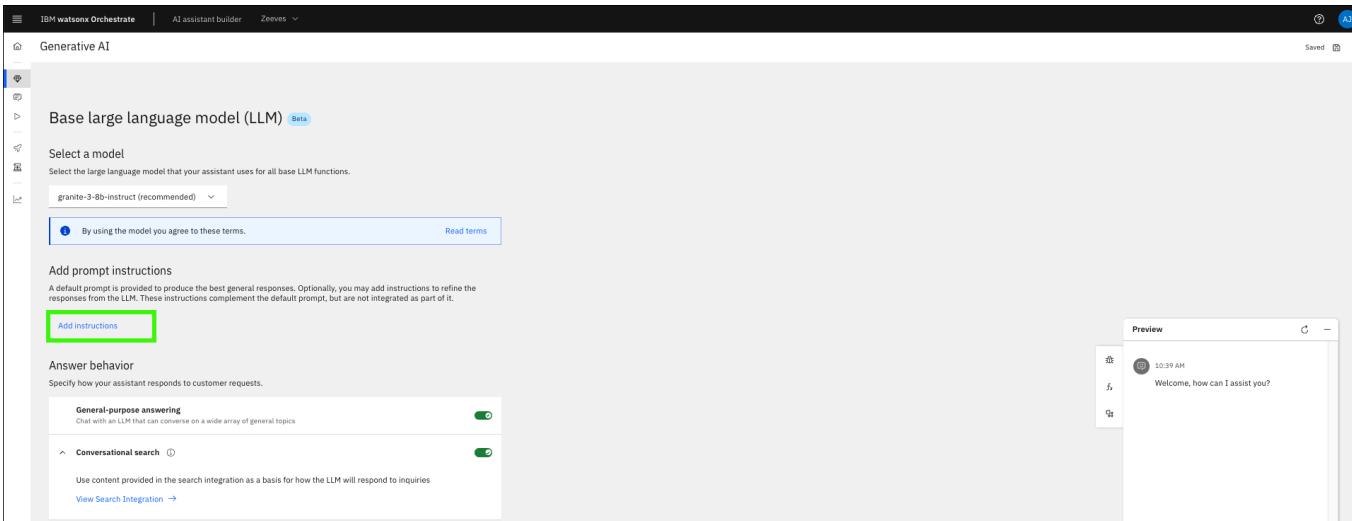

Configure the base large language model

After the preceding steps are completed, there are enhancements you can make to configure how the large language model (LLM) responds to your queries including adding prompt instructions and configuring the LLM's answer behavior. These options can be summarized [here](#).

1. Hover over the Home () and click Generative AI.

2. Click Add instructions.

3. Enter a prompt instruction.

Your assistant's LLM gives refined responses by following the prompt's instructions, which clarify how to achieve the end-goal of an action.

Enter prompt instructions in the field. The maximum number of characters you can enter in the prompt instruction field is 1,000.

The following is an example prompt instruction that works well. Experiment with different prompt instructions.

You are a subject matter expert on mainframe systems. Please respond to all prompts with truth and accuracy. Keep all answers short and concise, unless requested to provide details.

Note: When the instructions are typed in, they are automatically saved and the LLM is immediately trained on them.

The screenshot shows the 'Generative AI' configuration page. In the 'Answer behavior' section, the 'General-purpose answering' toggle switch is turned off (indicated by a greyed-out appearance). The 'Conversational search' toggle switch is turned on (indicated by a green background). A preview window on the right shows a message from 'Greet customer [default]' at 10:47 AM: 'Welcome, how can I assist you?'. The 'Save' button in the top right corner is highlighted with a blue box.

4. Toggle **General-purpose answering** to **Off** and then click **Save** (💾).

The ability exists to configure the answering behavior of your assistant to provide responses that are based on the preinstalled content or general content.

On the **Generative AI** page (under **Prompt Instructions**), you see the **Answer behavior** section. After you configure **Conversational search**, you see that it is enabled (toggled on) with the search integration added.

If you enable both general-purpose answering as well as conversational search, the conversational search answering takes precedence over General-purpose answering.

Recommendation: For purposes of retrieving Z-specific answers and responses, it is recommended that you turn off general-purpose answering and leave only conversational search turned on.

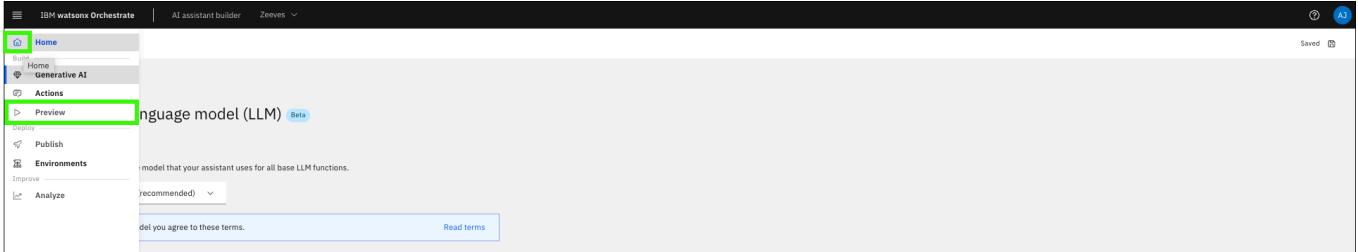

The screenshot shows the 'Generative AI' configuration page. In the 'Answer behavior' section, the 'General-purpose answering' toggle switch is turned off (indicated by a greyed-out appearance). The 'Conversational search' toggle switch is turned on (indicated by a green background). A preview window on the right shows a message from 'Greet customer [default]' at 10:47 AM: 'Welcome, how can I assist you?'. The 'Save' button in the top right corner is highlighted with a blue box.

Testing conversational search

Now you can begin issuing queries to test the assistant's responses.

Important: Modify settings iteratively based on your assessment of response quality. Review and change them at any time. For example, add extra prompt instructions, change response verbosity, and modify OpenSearch indexes.

1. Hover over the **Home** () and click **Preview**.

2. Experiment with different prompts and validate that the answers are reasonable and related to IBM Z.

Other prompts and responses follow.

Note: The responses that you receive can vary from the ones shown.

Prompt:

What is z/OS continuous delivery?

Example output:

Prompt:

What is the APF list in z/OS? Provide a detailed explanation?

Example output:

The screenshot shows the IBM Watsonx Orchestrate interface. On the left, there's a sidebar with icons for preview, AI assistant builder, and Zeeves. The main area has a title 'Sample website' and a large, mostly blank content area. On the right, there's a chat window titled 'Zeeves'. A message from 'You' at 11:02 AM asks, 'What is the APF list in z/OS? Provide a detailed explanation?' Below it, a response from 'Zeeves' at 11:02 AM provides a detailed explanation of the APF list, mentioning its role in controlling access to system resources and how it can be managed using system commands and macros. The response is highlighted with a green dashed box.

Prompt:

Why is Db2 different than other database systems?

Example output:

The screenshot shows the IBM Watsonx Orchestrate interface. On the left, there's a sidebar with icons for preview, AI assistant builder, and Zeeves. The main area has a title 'Sample website' and a large, mostly blank content area. On the right, there's a chat window titled 'Zeeves'. A message from 'You' at 11:03 AM asks, 'Why is Db2 different than other database systems?' Below it, a response from 'Zeeves' at 11:03 AM provides an explanation, mentioning that Db2 is a database management system (DBMS) that runs under the z/OS operating system, which is specific to mainframe computers. Other database systems may run on various operating systems like Oracle, MySQL, or PostgreSQL. Additionally, Db2 provides a higher level of data management and security features compared to other database systems, as it manages data stored in databases and controls access to the data. The response is highlighted with a green dashed box.

Prompt:

What happens during an IPL on IBM Z?

Example output:

The screenshot shows the IBM Watson Assistant for Z interface. At the top, there's a navigation bar with 'IBM Watsonx Orchestrate', 'AI assistant builder', and 'Zeeves'. Below the navigation is a toolbar with icons for preview, copy link, change layout, change background, and customize web chat. The main area is titled 'Sample website' and contains three large, light-gray rectangular boxes. In the bottom right corner of this area, there's a small input field with placeholder text 'Type something...'. To the right of the main content, a separate window titled 'Zeeves' is open, showing a message from 'You' at 11:05 AM: 'What happens during an IPL on IBM Z?'. The response text describes the process of loading an operating system into memory and begins executing it, mentioning various sources like Support Element (SE), Hardware Management Console (HMC), and Open Systems Adapter (OSA). A green box highlights the first sentence of the response. At the bottom of the Zeeves window, there's another input field with 'Powered by IBM Watsonx'.

Experiment with multi-turn (entire conversation) contextual awareness.

In the December 2024 release of IBM watsonx Assistant for Z support for multi-turn contextual awareness was added. This capability enables the assistant to use an entire session history for retrieving search results and generating answers. This handles context-dependent questions well but may over-rely on past topics, even if the user has moved on.

Experiment with this setting by changing your custom service contextual awareness setting from **Single turn** to **Entire conversation**.

The screenshot shows the 'Custom service' settings page in the IBM Watsonx Orchestrate AI assistant builder. The 'Contextual awareness' section is expanded, showing two options: 'Single turn' and 'Entire conversation'. The 'Entire conversation' option is selected and highlighted with a green border. A callout box provides a detailed description of how this feature works, stating: 'The assistant uses only the current user input for retrieving search results and generating answers. This works well for clear, complete inputs but generally won't work with context-dependent questions such as "What is that?" after a previous answer.' Below this, there is a note about defining the text for the citations title and a 'Search configuration' section.

Once enabled, try sequential prompts like:

What are some features of z/OS?

Give me an itemized list?

Tell me more about item 3.

You have a working assistant that uses IBM Watson Assistant for Z. Explore different prompt instructions and settings. If you encounter issues, refer to the Troubleshooting section that follows for resolution.

Continue to the [Creating a stand-alone OpenSearch instance for document ingestion](#) to learn how to configure a dedicated OpenSearch instance for ingesting client-specific documentation into the RAG model.

Troubleshooting

The following are issues that you may encounter. If the provided resolutions do not work, contact support by using the methods that are mentioned in the [Support](#) section.

 **Assistant responds to all prompts with, "I might have information related to your query to share, but am unable to connect to my knowledge base at the moment"** 

This Assistant is unable to connect to the custom service URL specified. This could be a network issue, the service may be down, the service may be restarting, or the service is no longer running at that URL.

Before reaching out to [Support](#), try the following:

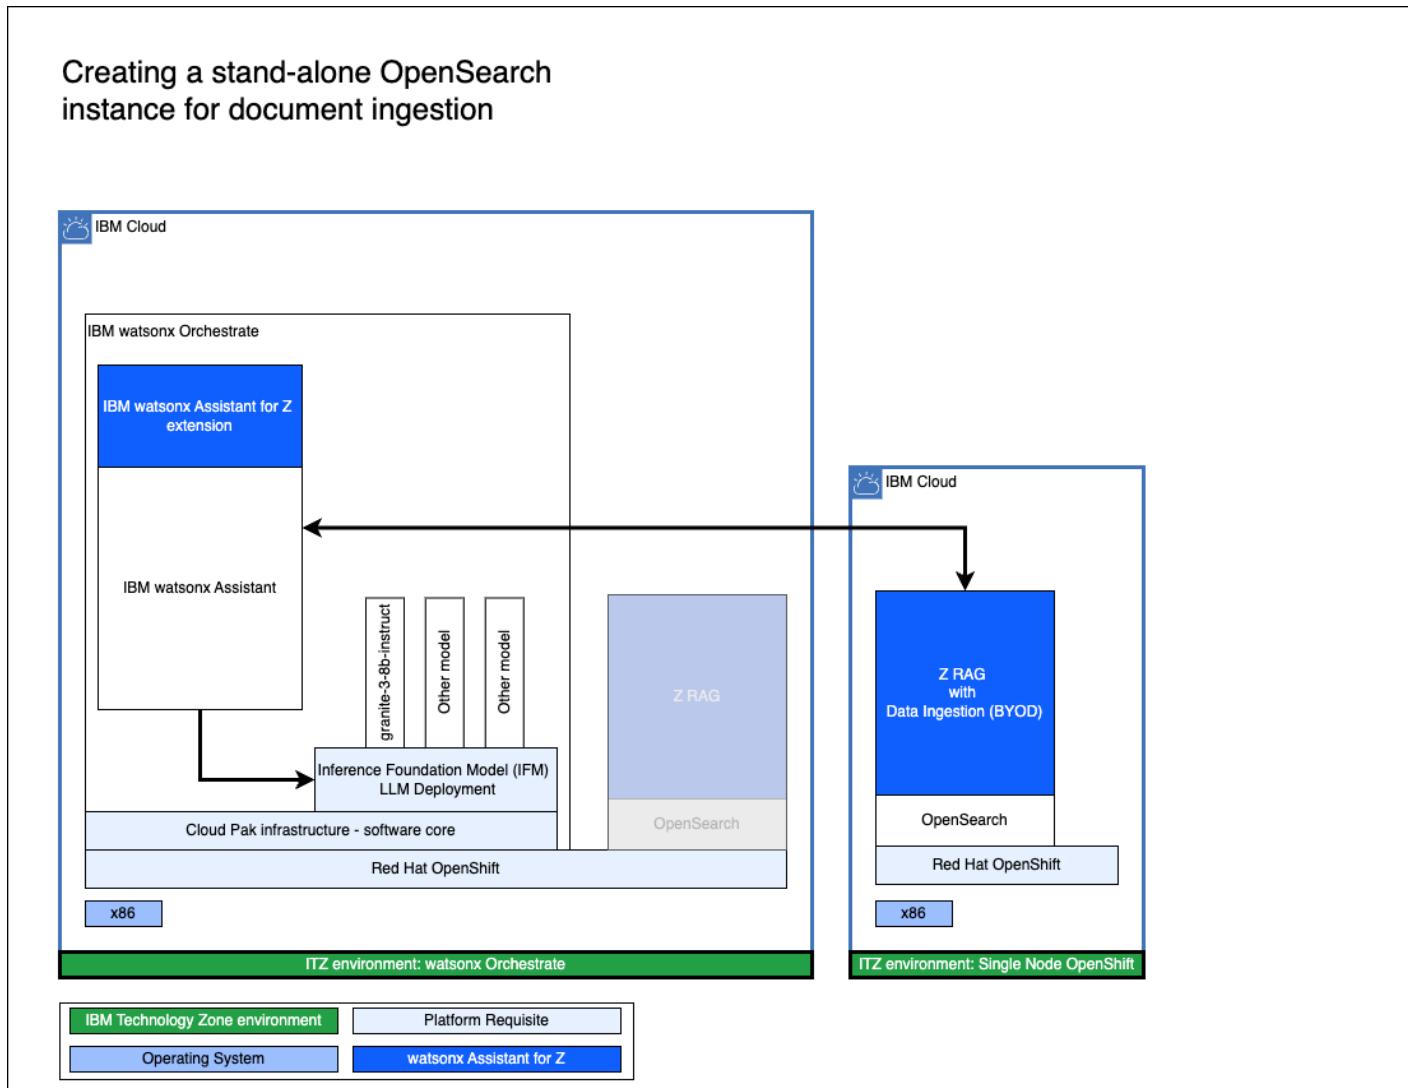

- Wait a few minutes and try again. It may be the service was in the process of restarting.
- If you printed this demonstration guide or saved a copy, verify you are using the most current version of the [lab guide](#) and the correct service URL (<https://wxa4z-opensearch-wrapper-wxa4z-demo-v2-1-0.wxo4z-opc-opensearch-clus-47e063e6a3ad1f71bf2e58f91c3b4c2e-0000.us-south.containers.appdomain.cloud/v1/query>). The URL may have changed since you saved or printed the lab guide.

Ingesting client documents

Creating a stand-alone OpenSearch instance for document ingestion

In this section, learn to enable clients to ingest their own documentation into the Retrieval Augmented Generation (RAG) used by IBM Watson Assistant for Z by deploying a dedicated [OpenSearch](#) instance, referred to as bring-your-own-search (BYOS).

Below is a high-level, logical architecture of the environment you will deploy in this section.

Earlier, you provisioned three IBM Technology Zone (ITZ) environments. One of which was a single-node Red Hat OpenShift (SNO) cluster. If you have not reserved this environment, or it is not in the **Ready** state, return to the [IBM Technology Zone environment](#) section to complete the reservation.

Install the Red Hat OpenShift command-line interface utility

The Red Hat OpenShift command-line interface (CLI) utility, which is known as **oc**, must be installed on your local workstation. If you already installed the **oc** utility, you can proceed to [log in to the SNO cluster](#).

1. Click the following link to open a browser window to your ITZ reservations.

[ITZ My reservations](#)

2. Click the **Single Node OpenShift** tile.

The screenshot shows the 'My reservations' section of the IBM Technology Zone. There are three cards displayed:

- Status - Ready**: Single Node OpenShift (VMware on IBM C...) - Education. Start date: Oct 31, 2024 7:02 AM, End date: Nov 6, 2024 6:49 AM, Extend limit: 0. [Open this environment](#)
- Status - Ready**: watsonx Assistant for Z Pilot - AAP & z/OS - Education. Start date: Oct 30, 2024 8:12 AM, End date: Nov 5, 2024 7:53 AM, Extend limit: 0. [Open this environment](#)
- Status - Ready**: watsonx Assistant for Z Pilot - watsonx O... - Education. Start date: Oct 30, 2024 8:10 AM, End date: Nov 5, 2024 7:12 AM, Extend limit: 0. [Open this environment](#)

3. Scroll down and record the **Cluster Admin Username** and **Cluster Admin Password**.

The screenshot shows the 'Reservation Details' page for a specific reservation. It includes the following information:

- API URL:** <https://api.672371d38376796fb96a6c4d.ocp.techzone.ibm.com:6443>
- Bastion Password:** (Redacted)

7. Click the link under **oc - OpenShift Command Line Interface (CLI)** for the operating system of your local machine.

The screenshot shows the 'Command Line Tools' section of the Red Hat OpenShift interface. On the left is a navigation sidebar with options like Home, Operators, Workloads, Networking, Storage, Builds, Observe, Compute, and User Management. The main content area has a blue header bar with the message 'You are logged in as a temporary administrative user. Update the cluster OAuth configuration to allow others to log in.' Below this, there's a 'Copy login command' button. The 'oc - OpenShift Command Line Interface (CLI)' section is highlighted with a green dashed border. It contains a brief description: 'With the OpenShift command line interface, you can create applications and manage OpenShift projects from a terminal.' followed by a bulleted list of download links for 'oc' binary: 'Download oc for Linux for x86_64', 'Download oc for Mac for x86_64', 'Download oc for Windows for x86_64', 'Download oc for Linux for ARM 64', 'Download oc for Mac for ARM 64', 'Download oc for Linux for IBM Power, little endian', 'Download oc for Linux for IBM Z', and 'LICENSE'. At the bottom of the content area, there's a link to 'helm - Helm 3 CLI'.

Clicking the preceding link automatically downloads either a **.zip** or **.tar** file specific to your operating system. Unzip or untar the file. Place the **oc** binary for your operating system (**OS**) in a directory that is in your default PATH, or set the PATH environment variable to include the location of the **oc** binary.

8. Verify the installation by running the **oc** command on your local workstation.

```
oc --help
```

Sample output:

```
andrewjones@Andrews-MBP ~ % oc --help
OpenShift Client

This client helps you develop, build, deploy, and run your applications on any
OpenShift or Kubernetes cluster. It also includes the administrative
commands for managing a cluster under the 'adm' subcommand.

Basic Commands:
  login           Log in to a server
  new-project     Request a new project
  new-app          Create a new application
  status           Show an overview of the current project
  project          Switch to another project
  projects         Display existing projects
  explain          Get documentation for a resource

Build and Deploy Commands:
  rollout          Manage a Kubernetes deployment or OpenShift deployment
  config           Revert part of an application back to a previous deployment
```

Mac/OS users may need to adjust security settings.

The **oc** binary may cause a security exception. Adjust the security settings by opening the **System Settings** utility and clicking **Privacy & Security**. Under **Security** locate the message about the **oc** binary and click **Allow Anyway**. Return to the terminal window and try the `oc --help` command again and click **Allow Anyway** when prompted.

Prepare to ingest documents

Before ingesting documents, complete the following setup steps.

Log in to the OpenShift cluster from your local terminal

Note: If you just installed the **oc** utility, skip the next 5 steps.

1. Click the following link to open a browser window to your ITZ reservations.

[ITZ My reservations](#)

2. Click the **Single Node OpenShift** tile.

3. Scroll to the bottom of the reservation page and record the **Cluster Admin Username** and **Cluster Admin Password**.

4. Click the **OCP Console** link.

oc - OpenShift Command Line Interface (CLI)

With the OpenShift command line interface, you can create applications and manage OpenShift projects from a terminal.

The oc binary offers the same capabilities as the kubectl binary, but it is further extended to natively support OpenShift Container Platform features.

- Download oc for Linux for x86_64

- Click **Display Token**.

Display Token

- Select and copy the **Log in with this token** string.

For most operating systems, double-click the value, then right-click and select **Copy**.

Your API token is
sha256~zuWR0KDnkYniIY0m8g8iKoUXPdFFFmou~o4s5FsrDNA

Log in with this token

```
oc login --token=sha256~zuWR0KDnkYniIY0m8g8iKoUXPdFFFmou~o4s5FsrDNA --server=https://api.672b79320c7a71b728e523b4.ocp.techzone.ibm.com:6443
```

Use this token directly against the API

```
curl -H "Authorization: Bearer sha256~zuWR0KDnkYniIY0m8g8iKoUXPdFFFmou~o4s5FsrDNA" "https://api.672b79320c7a71b728e523b4.ocp.techzone.ibm.com:6443/v1/users/~"
```

Request another token

[Logout](#)

A context menu is open over the token value, with 'Copy' highlighted.

9. Open a command prompt or terminal window on your local workstation.

10. Paste the login command and press **enter**.

```
andrewjones@Andrews-MBP ~ % oc login --token=sha256~mJ4L8K6cUMyNyk2Z69KMm3vbP1sWc8SW0eeOdVqtA94 --server=https://api.672371d38376796fb96a6c4d.ocp.techzone.ibm.com:6443
Logged into "https://api.672371d38376796fb96a6c4d.ocp.techzone.ibm.com:6443" as "kube:admin" using the token provided.
You have access to 70 projects, the list has been suppressed. You can list all projects with 'oc projects'
Using project "default".
andrewjones@Andrews-MBP ~ %
```

Create a working directory

1. Create a directory to store the configuration files that you will create in the next steps.

Instructions vary by your local workstation's operating system.

The directions that follow may vary depending on your operating system. The examples provided are based upon MacOS.

```
mkdir watsonxAssistant
```

2. Change to the new directory.

```
cd watsonxAssistant
```

```
andrewjones@Andrews-MBP ~ % oc login --token=sha256~mJ4L8K6cUMyNyk2Z69KMm3vbP1sWc8SW0eeOdVqtA94 --server=https://api.672371d38376796fb96a6c4d.ocp.techzone.ibm.com:6443
Logged into "https://api.672371d38376796fb96a6c4d.ocp.techzone.ibm.com:6443" as "kube:admin" using the token provided.
You have access to 70 projects, the list has been suppressed. You can list all projects with 'oc projects'
Using project "default".
andrewjones@Andrews-MBP ~ % mkdir watsonxAssistant
andrewjones@Andrews-MBP ~ % cd watsonxAssistant
andrewjones@Andrews-MBP watsonxAssistant %
```

Install IBM Certificate Manager on Red Hat OpenShift

1. In a text editor, create a file named `catalogCertManager.yaml` and paste the following text in the file.

Formatting of the yaml file is critical!

The content of the YAML file must be formatted exactly as shown. Use the **Copy** icon to prevent typographical errors.

File name:

```
catalogCertManager.yaml
```

File contents:

```
apiVersion: operators.coreos.com/v1alpha1
kind: CatalogSource
metadata:
  name: ibm-cert-manager-catalog
  namespace: openshift-marketplace
spec:
  displayName: ibm-cert-manager-4.2.7
  grpcPodConfig:
    securityContextConfig: restricted
    image: icr.io/cpopen/ibm-cert-manager-operator-
catalog@sha256:4dcf4ace4b5f166f83b31063f7e6404dbf78d8e98a9d4fcf52fedf576a55ca6c
  publisher: IBM
  sourceType: grpc
  updateStrategy:
    registryPoll:
      interval: 30m0s
```

2. Install the IBM Certificate Manager operator in the Red Hat OpenShift cluster.

```
oc apply -f catalogCertManager.yaml
```

The preceding command returns a message that states the **ibm-cert-manager-catalog** was created.

3. In the OpenShift web console, click **Operators** and then select **OperatorHub**.

The screenshot shows the Red Hat OpenShift web console interface. The left sidebar has a navigation menu with items like 'Administrator', 'Home', 'Operators' (which is currently selected and highlighted in green), 'OperatorHub' (which is also highlighted in green), and 'Installed Operators'. The main content area has a blue header bar with the text 'You are logged in as a temporary administrative user. Update the cluster OAuth configuration to allow others to log in.' Below this, there's a section titled 'Command Line Tools' with a 'Copy login command' button. Another section titled 'oc - OpenShift Command Line Interface (CLI)' provides information about the 'oc' binary and links to download it for various platforms.

4. Click the **Project** to pull-down menu and click the **Show default projects** toggle.

The screenshot shows the Red Hat OpenShift OperatorHub interface. On the left, there's a navigation sidebar with options like Home, Operators, Workloads, Networking, etc. The 'OperatorHub' section is currently selected. In the main area, there's a dropdown menu labeled 'Project: All Projects'. A green box highlights this dropdown. Below it is a search bar with the placeholder 'Select project...'. There's also a toggle switch for 'Show default projects'. A list of projects is shown, including 'All Projects', 'default', 'kube-node-lease', and 'kube-public'. At the bottom right, it says '624 items'. Navigation tabs at the bottom include 'Community', 'Marketplace', and 'Community' again.

5. Scroll down and select openshift-marketplace.

This screenshot shows the same interface as above, but with the 'openshift-marketplace' operator selected from the list of installed operators. A green box highlights this selection. The interface shows various other operators like 'openshift-kube-controller-manager-operator', 'openshift-kube-scheduler', etc. To the right, there are several tiles representing different operators, including CrowdStrike Operator, Abot Operator, Accuknox Operator, and Red Hat Advanced Cluster Management for Kubernetes. The 'Community' and 'Marketplace' tabs are visible at the bottom.

6. Enter IBM Cert Manager in the search field and then click the IBM Cert Manager tile.

Be patient.

It may take a minute or two for the **IBM Cert Manager** tile to appear.

Note: The current version of the operator may differ than the one shown in the image below. Select the most current version.

This screenshot shows the Red Hat OpenShift OperatorHub interface with a search query 'IBM Cert Manager' entered in the search bar. A green box highlights the search bar. The search results show one item: 'ibm-cert-manager-4.2.7' under the 'All Items' category. This item is also highlighted with a green box. The interface includes a sidebar with categories like Home, Operators, Workloads, etc., and a navigation bar at the top.

7. Click Install.

The screenshot shows the Red Hat OpenShift OperatorHub interface. On the left, there's a sidebar with navigation links like Home, Operators, Workloads, Networking, Storage, Builds, Observe, and Compute. Under Operators, 'OperatorHub' is selected. In the main content area, a search bar at the top right says 'All Items' and has 'IBM Cert Manager' typed into it. Below the search bar, there's a list of operators. One operator, 'ibm-cert-manager-4.2.7' by IBM, is highlighted with a green border. To the right of this operator, a detailed card is displayed with the title 'IBM Cert Manager 4.2.7 provided by IBM'. It features a large 'Install' button at the top. Below the button, there are sections for 'Channel' (set to v4.2), 'Version' (set to 4.2.7), 'Capability level' (with 'Basic Install' and 'Seamless Upgrades' selected), and 'Source' (ibm-cert-manager-4.2.7). A descriptive text box explains the use of the operator to manage certificates.

8. Keep the default settings and click Install.

This screenshot shows the 'Install Operator' configuration page for the 'ibm-cert-manager' operator. The left sidebar is identical to the previous screenshot. The main area is titled 'Install Operator' and contains several configuration fields:

- Update channel ***: Set to 'v4.2'.
- Version ***: Set to '4.2.7'.
- Installation mode ***: Set to 'All namespaces on the cluster (default)'.
- Installed Namespace ***: Set to 'Operator recommended Namespace: ibm-cert-manager'.
- Namespace creation**: A note stating 'Namespace ibm-cert-manager does not exist and will be created.'
- Update approval ***: Set to 'Automatic'.

On the right side, there are four cards representing provided APIs:

- CR CertificateRequest**: Not available.
- CMC Cert Manager Config**: Describes CertManagerConfig as the Schema for certmanagerconfigs API. It includes documentation and a license link.
- Challenge**: Not available.
- ClusterIssuer**: Not available.
- Issuer**: Describes an Issuer as a certificate issuing authority.

At the bottom left, there are 'Install' and 'Cancel' buttons, with 'Install' being highlighted.

**Do not continue until...**

The installation process takes a few minutes. Do not continue until you see the following message: **Installed operator: ready for use.**

The screenshot shows the Red Hat OpenShift web interface. The left sidebar has a 'Operators' section with 'OperatorHub' selected. The main content area displays the 'IBM Cert Manager' operator card. The card includes a blue cloud icon, the name 'IBM Cert Manager', the version 'ibm-cert-manager-operator:v4.2.7 provided by IBM', and a green checkmark icon. Below the card, the text 'Installed operator: ready for use' is displayed, followed by two buttons: 'View Operator' and 'View installed Operators in Namespace ibm-cert-manager'. The entire message area is enclosed in a green dashed box.

Install the watsonx Assistant for Z Operator (for OpenSearch)

1. In your command prompt or terminal window, create a new namespace called `wxa4z-byos` in the Red Hat OpenShift cluster.

```
oc create namespace wxa4z-byos
```

2. Create or obtain your IBM Container Software production entitlement key.

A production entitlement key is required to pull the container images that get deployed by the operator.

To create or retrieve your existing entitlement key, follow the instructions [here](#).

If additional assistance is needed, refer to this [site](#).

After locating your existing key or creating a new key, continue to the next step.

3. Click **copy** and record your entitlement key for future use in a secure location.

The screenshot shows the IBM Container Software and Cloud Pak Access Management interface. On the left, there's a sidebar with 'My IBM', 'Profile', 'Billing', and 'Entitlement keys' selected. Below that is a 'Container software library'. The main area is titled 'Entitlement keys (1)'. It says 'Access your container software' and explains that an entitlement key allows access to all container software in the IBM Entitled Registry. It also mentions a 'container software library'. Under 'Active entitlement keys', it says 'Use any active entitlement key to log in to the image registry and retrieve any container software you own.' It notes that you can have a maximum of 5 entitlement keys and that once deleted, they're no longer valid. A button 'Add new key' with a '+' icon is at the top right. Below that is a section with 'Issue date: October 17, 2022' and a long entitlement key string. At the bottom right are 'Copy' (green border), 'Delete' (red border), and 'Edit' buttons.

4. In your command prompt or terminal window, set an environment variable with your production entitlement key.

Substitute your production entitlement key copied in the last step for <entitlement key> .

```
export IBM_CS_ENT_KEY=<entitlement key>
```

5. Enter the following command to create a pull secret for the **Container Registry**.

```
oc -n wxa4z-byos create secret docker-registry icr-pull-secret --docker-server=cp.icr.io --  
docker-username=cp --docker-password=$IBM_CS_ENT_KEY
```

The terminal window shows the command being run. The line 'secret/icr-pull-secret created' is highlighted with a green box. The entire command line is also highlighted with a green box.

6. In a text editor, create a file named `catalogSource.yaml` and paste the following text in the file.

Formatting of the yaml file is critical!

The content of YAML files must be formatted exactly as shown. Use the copy icon to prevent typographical errors.

File name:

```
catalogSource.yaml
```

File contents:

```

apiVersion: operators.coreos.com/v1alpha1
kind: CatalogSource
metadata:
  name: ibm-wxa4z-operator-catalog
  namespace: wxa4z-byos
spec:
  displayName: "IBM watsonx Assistant for Z Operator Catalog"
  image: icr.io/cpopen/ibm-wxa4z-
  catalog:v2.1.0@sha256:a085d360b6aa0e40cf86a632eb5cd190a0407d1c54ec1b2d1d2fb5507f39a524
  publisher: 'IBM'
  sourceType: grpc
  secrets:
    - icr-pull-secret

```

7. Create your document catalog in the Red Hat OpenShift operator.

```
oc apply -f catalogSource.yaml
```

```

andrewjones@Andrews-MBP watsonxAssistant % oc create namespace wxa4z-byos
namespace/wxa4z-byos created
andrewjones@Andrews-MBP watsonxAssistant % export IBM_CS_ENT_KEY=eyJ0eXAiOiJKV1QiLCJhbGciOiJIUzI1NiJ9eyJpc3MiOiJJQk0gTWFya2V0cGxhY2UiLCJpXXQiOjE2NjYwMTk1ODAsImp0aSI6IjNKOWUyMzzjZTAzMDQzMzVhNTJhYTkzMWNmOTcyMDR1In0.4M3XRD4XzkHMSOkFNJ4uKvcWZ6SnEA0Z03eL_11A2XY
andrewjones@Andrews-MBP watsonxAssistant % oc -n wxa4z-byos create secret docker-registry icr-pull-secret --docker-server=cp.icr.io --docker-username=cp --docker-password=$IBM_CS_ENT_KEY
secret/icr-pull-secret created
andrewjones@Andrews-MBP watsonxAssistant % vi catalogSource.yaml
andrewjones@Andrews-MBP watsonxAssistant % vi catalogSource.yaml
andrewjones@Andrews-MBP watsonxAssistant % oc apply -f catalogSource.yaml
catalogsource.operator.coreos.com/ibm-wxa4z-operator-catalog created:
andrewjones@Andrews-MBP watsonxAssistant %

```

8. In the Red Hat OpenShift web console, click **OperatorHub** and select the **wxa4z-byos** project.

The screenshot shows the Red Hat OpenShift web console with the 'OperatorHub' section selected. The 'Project' dropdown is set to 'openshift-marketplace'. A search bar at the top has 'wxa4z-byos' typed into it. Below the search bar, a list of operators is shown, with 'wxa4z-byos' highlighted. To the right, there are four operator cards displayed:

- CrowdStrike Operator**: [DEPRECATED] CrowdStrike Operator provided by CrowdStrike
- Abot Operator-v3.0.0**: Abot Operator-v3.0.0 provided by Rebeca Technologies Pvt Ltd
- Accuknox Operator**: Certified provided by Accuknox Inc.
- Advanced Cluster Management for Kubernetes**: Red Hat

9. Enter **ibm watsonx** in the search field and the click the **IBM watsonx Assistant for Z Operator Catalog** tile.

It may take a minute or two for the **IBM watsonx Assistant for Z Operator Catalog** tile to appear.

Note: The current version of the operator may differ than the one shown in the image below.

You are logged in as a temporary administrative user. Update the cluster OAuth configuration to allow others to log in.

Project: wxa4z-byos

OperatorHub

Discover Operators from the Kubernetes community and Red Hat partners, curated by Red Hat. You can purchase commercial software through Red Hat Marketplace. You can install Operators on your clusters to provide optional add-ons and shared services to your developers. After installation, the Operator capabilities will appear in the Developer Catalog providing a self-service experience.

11. Select A specific namespace on the cluster (a) under Installation mode and wxa4z-byos (b) for the Installed Namespace, then click **Install** (c).

Do not continue until...

The installation process takes a few minutes. Do not continue until you see the following message: **Installed operator: ready for use.**

12. In your command prompt or terminal window, run the following commands to add the Container Registry credential to the operator's service account.

```
oc project wxa4z-byos
```

For MacOS users:

```
oc patch serviceaccount ibm-wxa4z-operator-controller-manager --type merge -p
'{"imagePullSecrets": [{"name": "icr-pull-secret"}]}'
```

For Microsoft Windows users:

```
oc patch serviceaccount ibm-wxa4z-operator-controller-manager --type merge -p "
{\\"imagePullSecrets\\": [{"\\name\\":\\"icr-pull-secret\\"}]}"
```

The terminal session shows the creation of a namespace 'wxa4z-byos', export of the IBM_CS_ENT_KEY, creation of a secret 'docker-registry icr-pull-secret' with the key, application of a catalog source, and finally patching the service account 'ibm-wxa4z-operator-controller-manager' with the new image pull secret. The command 'oc project wxa4z-byos' is highlighted with a green dotted box.

```
andrewjones@Andrews-MBP watsonxAssistant % oc create namespace wxa4z-byos
namespace/wxa4z-byos created
andrewjones@Andrews-MBP watsonxAssistant % export IBM_CS_ENT_KEY=eyJ0eXAiOiJKV1QiLCJhbGciOiJIUzI1NiJ9.eyJpc3MiOiJJQk0gTWFya2V0cGxhY2UiLCJpYXQiOjE2NjYwMTk1ODAsImp0aS16IjNkOWUyMzZjZTAzM0QzMzVhNTJhYTkzMWNmOTcyMDR1In0.4M3XRD4XzkHMSOkFNJ4uKVcwZ6SnEA0Z03eL_11A2xY
andrewjones@Andrews-MBP watsonxAssistant % oc -n wxa4z-byos create secret docker-registry icr-pull-secret --docker-server=cp.icr.io --docker-username=cp --docker-password=$IBM_CS_ENT_KEY

```

13. In the Red Hat OpenShift web console, under **Workloads**, click **Pods**.

The screenshot shows the Red Hat OpenShift web console interface. The left sidebar is open, showing the navigation menu with 'OperatorHub' selected under 'Operators'. The main content area displays a card for 'IBM watsonx Assistant for Z', which is version 2.0.1 and was provided by IBM. A green dotted box highlights the 'Installed operator ready for use' status at the bottom of the card.

14. Verify the two pods that start with **ibm-wxa4z-operator** have a status of **Running** and that all pods are **Ready**.

The screenshot shows the Red Hat OpenShift web console interface. The left sidebar is open, showing the navigation menu with 'Pods' selected under 'Workloads'. The main content area displays a table of pods. There are two entries: one for 'ibm-wxa4z-operator-catalog-n9m5m' and another for 'ibm-wxa4z-operator-controller-manager-7c7898d7d4-87htm'. Both pods are listed as 'Running' with a green dotted box around them. The 'Status' column shows 'Completed' for the first pod and 'Running' for the second. The 'Ready' column shows '0/1' for the first and '2/2' for the second. Other columns include 'Name', 'Owner', 'Memory', 'CPU', and 'Created'.

Name	Status	Ready	Owner	Memory	CPU	Created

Deploy required secrets and the custom bring-your-own-search (BYOSearch) resources

1. In a text editor, create a file named `os-secret.yaml` and paste the following text in the file.

File name:

```
os-secret.yaml
```

Substitute a secure password of your choosing for the string `<OPENSEARCH_PASSWORD>`.

File contents:

```
apiVersion: v1
stringData:
  password: <OPENSEARCH_PASSWORD>
kind: Secret
metadata:
  name: opensearch-creds
  namespace: wxa4z-byos
type: Opaque
```

2. Create the secret by running the following command.

```
oc apply -f os-secret.yaml
```

3. In a text editor, create a file named `client-ingestion-secret.yaml` and paste the following text in the file.

File name:

```
client-ingestion-secret.yaml
```

Substitute a secure authentication key of your choosing for the string `<CLIENT_INGESTION_AUTHKEY>`. The authentication key can be a random password.

File contents:

```

apiVersion: v1
stringData:
  authkey: <CLIENT_INGESTION_AUTHKEY>
kind: Secret
metadata:
  name: client-ingestion-authkey
  namespace: wxa4z-byos
type: Opaque

```

4. Create the secret by running the following command.

```
oc apply -f client-ingestion-secret.yaml
```

5. In a text editor, create a file named `wrapper-creds.yaml` and paste the following text in the file.

File name:

```
wrapper-creds.yaml
```

Substitute a secure password credential of your choosing for the string `<WRAPPER_PASSWORD>`. The password can be a random password. Use this password in the following steps when you configure your BYOS connection in your assistant to connect to the network route.

File contents:

```

apiVersion: v1
stringData:
  username: admin
  password: <WRAPPER_PASSWORD>
kind: Secret
metadata:
  name: wrapper-creds
  namespace: wxa4z-byos
type: Opaque

```

6. Create the secret by running the following command.

```
oc apply -f wrapper-creds.yaml
```

7. Obtain and record your cluster domain that is used for routes by running the following command.

```
oc -n openshift-ingress-operator get ingresscontroller default -o jsonpath=".status.domain"
```

The output from the command does not include a newline.

The value returned for the cluster domain does not include a newline. When copying the value do not include the character or characters used for your command line prompt. Do not include the your prompt in the next step!

Note: The output of the command will be a string similar to:
apps.672b79320c7a71b728e523b4.ocp.techzone.ibm.com

8. In a text editor, create a file named `byos.yaml` and paste the following text in the file.

File name:

```
byos.yaml
```

Substitute the domain name recorded in the previous step for the string `<YOUR_CLUSTER_DOMAIN>`.

File contents:

```

apiVersion: wxa4z.watsonx.ibm.com/v1
kind: BYOSearch
metadata:
  name: byosearch
  namespace: wxa4z-byos
spec:
  imagePullSecrets:
    - name : icr-pull-secret
  namespace: wxa4z-byos
  clusterName: wxa4z-byos-cluster
  clusterDomain: <YOUR_CLUSTER_DOMAIN>

  opensearch:
    secretName: opensearch-creds

  persistence:
    enabled: true
    storageClass: "managed-nfs-storage"
    accessModes:
      - ReadWriteOnce
    size: 24Gi

  wrapper:
    createRoute: true
    resources:
      requests:
        cpu: 2
        memory: "500Mi"
      limits:
        cpu: 2
        memory: "1Gi"

  clientIngestion:
    secretName: client-ingestion-authkey

    resources:
      limits:
        cpu: "500m"
        memory: 2Gi
        nvidia.com/gpu: "0"
      requests:
        cpu: "500m"
        memory: 1Gi
        nvidia.com/gpu: "0"
    pvc:
      storageClass: "managed-nfs-storage"
      enabled: true
      size: 24Gi

```

9. Run the following command to deploy BYOS on your cluster.

```
oc apply -f byos.yaml
```

Verify all the required pods are running and get the network route to your BYOS instance

1. In the OCP console, verify that all pods have the status of **Running** or **Completed**.

⚠️ Do not continue until...

The BYOS deployment can take 20 minutes or more to complete. Do not continue until all the pods have a status of "Running" or "Completed". The next step is to retrieve your BYOS endpoint URL.

Name	Status	Ready	Restarts	Owner	Memory	CPU	Created

3. Copy and record the location for the **wxa4z-opensearch-wrapper** route.

Name	Status	Location	Service
wxa4z-client-ingestion	Accepted	https://wxa4z-client-ingestion-wxa4z-byos.apps.672b79320c7a71b728e523b4.ocp.techzone.ibm.com	wxa4z-client-ingestion
wxa4z-opensearch-wrapper	Accepted	https://wxa4z-opensearch-wrapper-wxa4z-byos.apps.672b79320c7a71b728e523b4.ocp.techzone.ibm.com	wxa4z-opensearch-wrapper

Update your assistant with the new BYOS instance route

You are now ready to configure your assistant with the route to your BYOS instance.

1. Using the network route for your BYOS instance, append the string /v1/query to complete the URL endpoint.

The URL should look similar to:

```
https://wxa4z-opensearch-wrapper-wxa4z-
byos.apps.672b79320c7a71b728e523b4.ocp.techzone.ibm.com/v1/query
```

Important: The above URL will not work for you. Use the value of your specific OpenSearch instance that is recorded in the previous step.

2. Update your assistant's custom search integration URL.

Next, you need to return to your assistant in the watsonx Orchestrate AI assistant builder and update the custom search integration URL. This time, instead of setting the authentication type to **None**, you need to set it to **Basic authentication**. Use **admin** for the **Username** and the **Password** will be the password you specified in the `wrapper-creds.yaml` file.

The steps to update the URL are illustrated in the animated gif that follows. You can review the steps to accomplish this [here](#) (be sure to use your BYOS URL and not the shared URL specified in the lab guide).

Troubleshooting

The following are issues that you may encounter. If the provided resolutions do not work, contact support by using the methods that are mentioned in the [Support](#) section.

✖ Pods have a status of ErrImagePull or ImagePullBackoff

If the pods starting with **ibm-wxa4z-operator** have a status of “ErrImagePull” or “ImagePullBackoff”, you can delete the pod and it will automatically restart and pull the image successfully. Wait until the pod is re-created successfully.

✖ The wxa4z-client-ingestion pod does not start

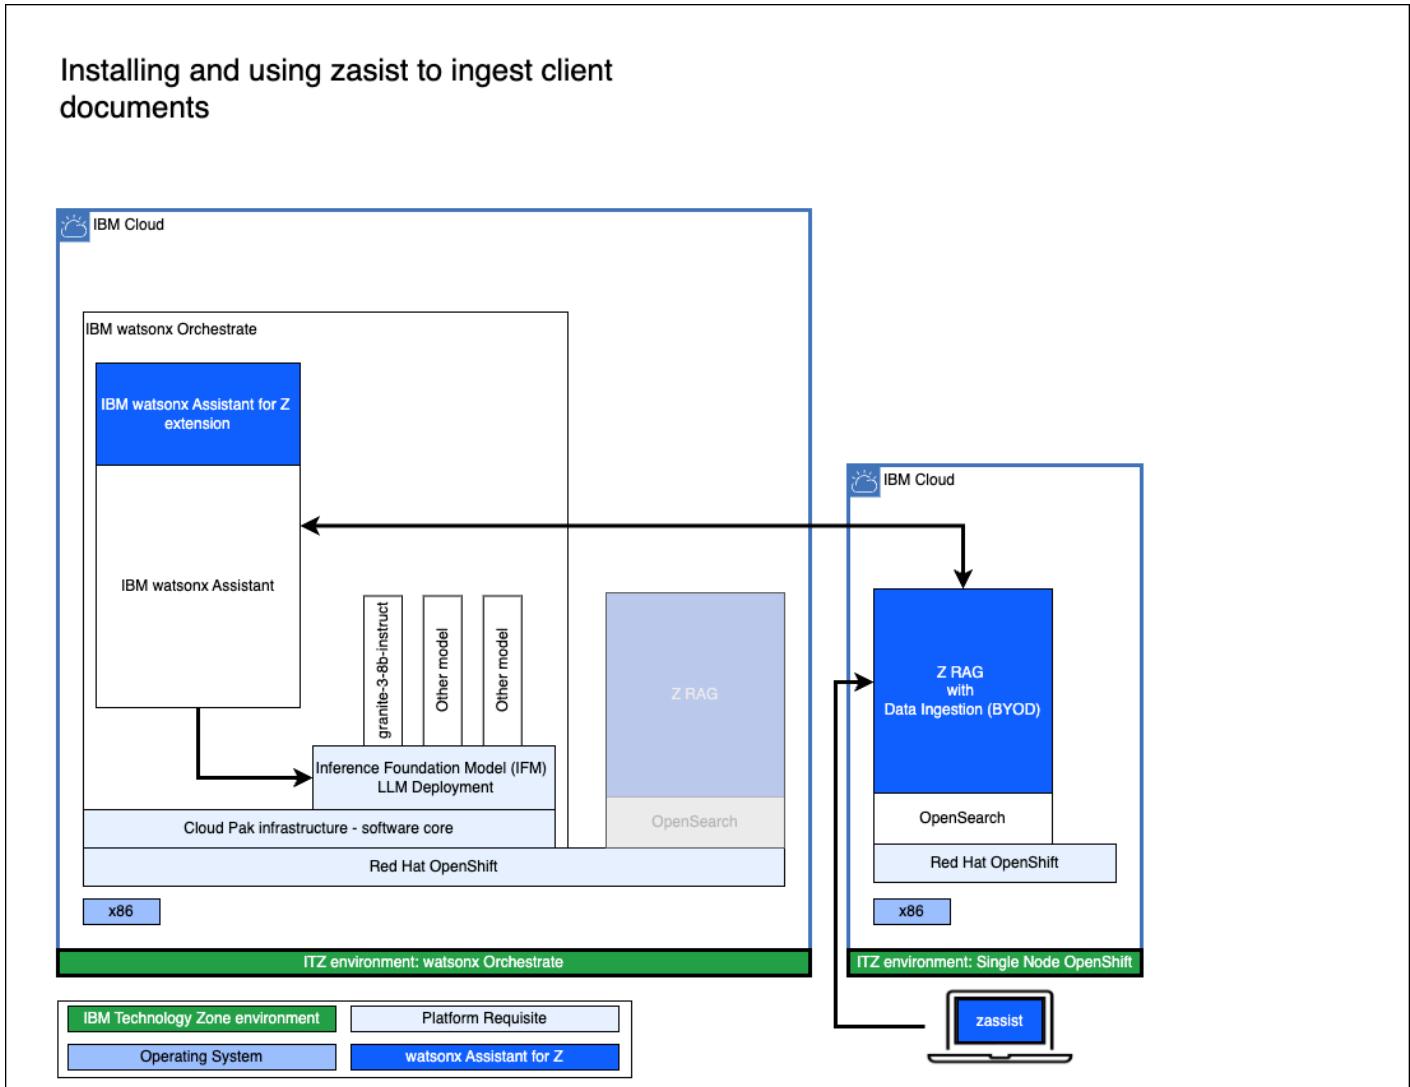

Did you include the % character in the **clusterDomain** name when creating the **byos.yaml**? To resolve, edit the **byos.yaml** file and run the following command again. The current pod will be terminated and a new one started. This will take about 20 minutes to start.

```
oc apply -f byos.yaml
```

Installing and using zassist to ingest client documents

With bring-your-own-search (BYOS) installed and configured in your assistant, you can now prepare for document ingestion. Currently, only PDF, HTML, and DOCX file formats are supported for ingestion.

Below is a high-level, logical architecture of the environment you will deploy in this section.

To prepare for document ingestion, you can also reference the setup instructions that are located [here](#).

Install the zassist utility

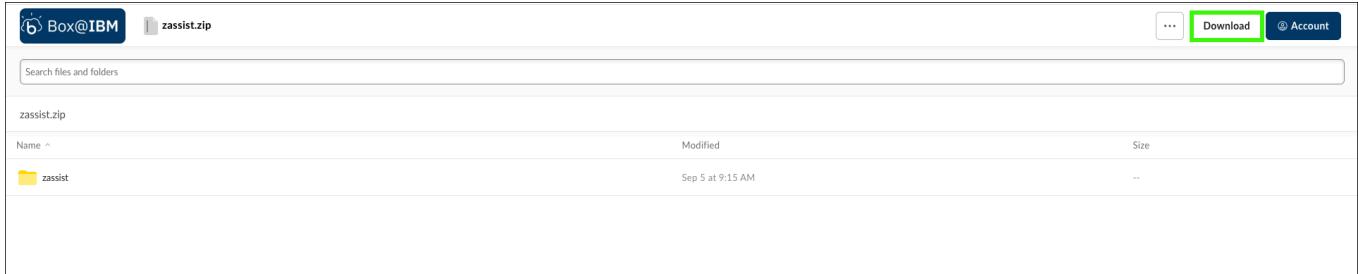

The **zassist** utility is an executable program that automates the ingestion of client documentation into the RAG for Watsonx Assistant for Z. A version of zassist is available for download for IBMers and Business Partners for conducting pilots. Follow the steps below to download and install **zassist**.

How do clients get the zassist utility?

The utility is available to clients through [IBM Passport Advantage](#).

1. Click the following link and download the **zassist.zip** file.

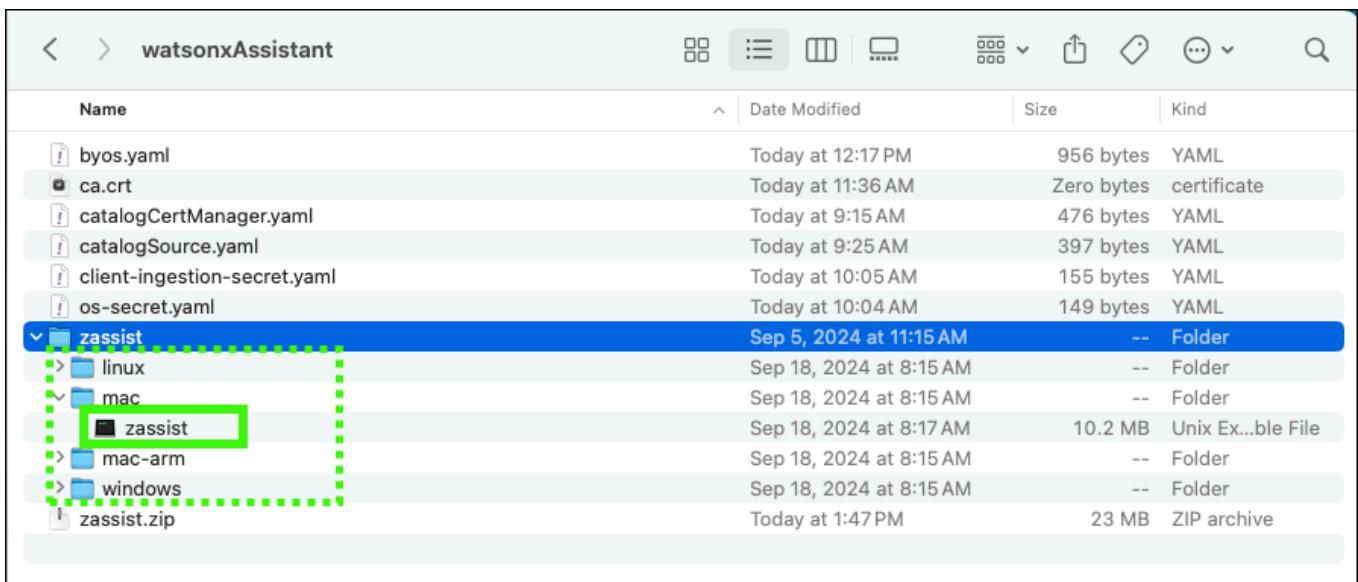

<https://ibm.box.com/s/j3nt5iw4fqd5w2jgcqwxnjlsu8bpvl77>

A screenshot of the IBM Box web interface. At the top, it shows 'Box@IBM' and the file name 'zassist.zip'. Below is a search bar and a table listing the contents of the zip file. The table has columns for Name, Modified, Size, and Kind. It contains one item: 'zassist' (Modified Sep 5 at 9:15 AM, Size --, Kind Unix Executable File). At the bottom right of the table is a green 'Download' button.

2. Extract the **zassist.zip** file.

3. Locate the appropriate file for your local workstation's operating system.

A screenshot of a file explorer window titled 'watsonxAssistant'. The left pane shows a tree view of files and folders. The 'zassist' folder is expanded, revealing subfolders 'linux', 'mac', 'mac-arm', and 'windows'. Inside the 'mac' folder, there is a file named 'zassist' which is highlighted with a green selection box. The right pane is a table listing the files and their details: byos.yaml, ca.crt, catalogCertManager.yaml, catalogSource.yaml, client-ingestion-secret.yaml, os-secret.yaml, zassist (a folder), linux (a folder), mac (a folder), mac-arm (a folder), windows (a folder), and zassist.zip. The 'zassist' file in the 'mac' folder is listed with a size of 10.2 MB and a modified date of Sep 5, 2024 at 8:17 AM.

4. Either copy the appropriate **zassist** file to a directory in your PATH, or add the appropriate directory to your PATH environment variable.

Additional information for running the preceding tasks can be found [here](#).

5. Run the **zassist** command to verify it is working.

A screenshot of a terminal window. The command 'zassist' is typed into the input field. The output shows an error message: 'zassist: error: expected one of "version", "init", "login", "ingest", "load", ...'. The terminal window title is 'watsonxAssistant -- zsh -- 157x40'.

Mac/OS users may need to adjust security settings.

The **zassist** binary may cause a security exception. Adjust the security settings by opening the **System Settings** utility and clicking **Privacy & Security**. Under **Security** locate the message about the **zassist** binary and click **Allow Anyway**. Return to the terminal window and try running the command again.

Ingest client documentation using zassist

With the **zassist** command installed, you are now able to begin ingesting data.

Step-by-step guidance for ingesting documents using zassist is provided in the IBM watsonx Assistant for Z documentation.

1. Follow the directions [here](#) to ingest documents using zassist.

The steps are not repeated in this lab guide. The following video illustrates the steps to ingest a single document. The document that is ingested in the video is a compressed PDF of the **IBM z/OS Continuous Delivery Red Piece**. You can download a copy of this document [here](#).

Note: The video has no audio.

Don't see the video in the PDF version of the lab guide?

If you are viewing the [PDF](#) of the lab guide, you can access the video [here](#).

Adjusting the search behavior

Do you recall the **Metadata** field when you configured your assistant?

The screenshot shows the 'Custom service' configuration page in the AI assistant builder. The 'Metadata' field is highlighted with a green dashed border. The JSON example provided is:

```
{
  "example_field": "example_value",
  "other_example_field": 7
}
```

The Metadata field provides a way to adjust your assistant's behavior during conversational search for your OpenSearch instance. Now that you have your own docs that are ingested for conversational search, you can set the metadata field for your assistant to use those documents in its content-grounded search. If you leave the metadata field empty, then it defaults to settings found to perform well but may not use the ingested documents as part of the search results.

If you leave the Metadata field empty, OpenSearch will rely on the default settings, which means OpenSearch will search all of the default IBM-provided documentation and all of the ingested customer documentation using the following value:

```
{"ibm_indices": "*_ibm_docs_slate,*_ibm_redbooks_slate",
"customer_indices": "customer_*"}
```

Replacing the wildcard string with an explicit list of indices allows for personalization. The metadata setting is where you can input specific indices (pointing to the underlying documentation) that you want your assistant to use for the content-grounded search. There are over 220 products and topics that the OpenSearch instance has IBM Documentation for. You can find those indices and products [here](#).

You can input a subset of indices into the “Metadata” field in cases where you only want your assistant to gather context for specific IBM products or topics. The specific indices can be listed out in this format:

```
{"ibm_indices": "<comma separated index values>","customer_indices": "customer_*"}
```

For example, if you only want your assistant to reference documentation for “Db2 Analytics Accelerator for z/OS” and no ingested client documentation, you can enter the following into the metadata field:

```
{"ibm_indices": "ss4lq8_ibm_docs_slate"}
```

If you have a mix of IBM Documentation and client documentation ingested, then there's an optional search string that you can use to set the "weights" used for each.

For example:

```
{"doc_weight":  
{"product_docs":0.5,  
"customer_docs":0.5},  
"ibm_indices": "*_ibm_docs_slate,*_ibm_redbooks_slate",  
"standardize":true,  
"customer_indices": "customer_*"  
}
```

In this case, "product_docs" is the weight that is assigned to "ibm_indices" and "customer_docs" is the weight that is assigned to "customer_indices". For more information on customizing the metadata field for conversational search, refer to this supplemental video found [here](#).

Verify the document that is ingested is now returned as a source file for a query

Use the watsonx Orchestrate AI assistant builder to verify your document ingestion.

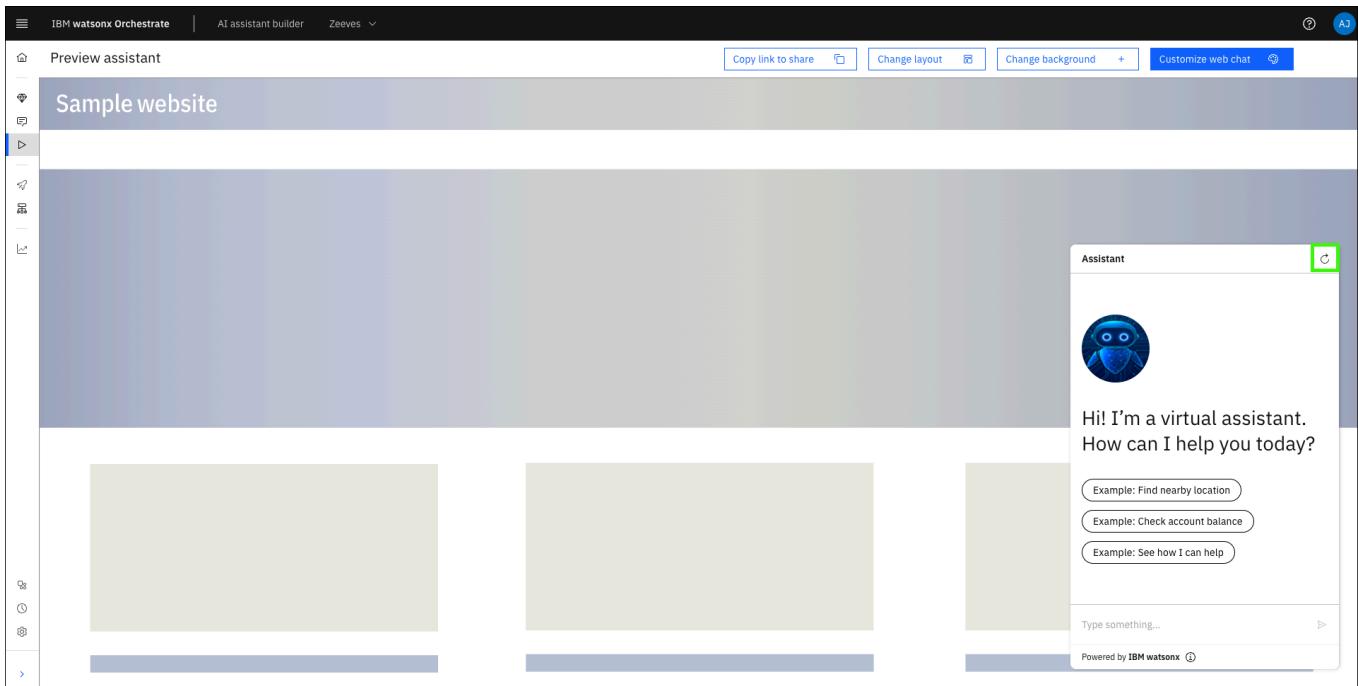

You may not receive the same results as shown below.

In the 4Q 2024 release of IBM watsonx Assistant for Z, additional IBM documents were added to the RAG including many IBM RedBooks. The new data changes the results returned when using the sample IBM Red Piece ingested earlier. To reproduce the results shown, you can modify the Metadata field for your assistant to remove the IBM Redbooks from the IBM indicies:

```
{"doc_weight":  
{"product_docs":0.5,  
"customer_docs":0.5},  
"ibm_indices": "*_ibm_docs_slate",  
"standardize":true,  
"customer_indices": "customer_*"  
}
```

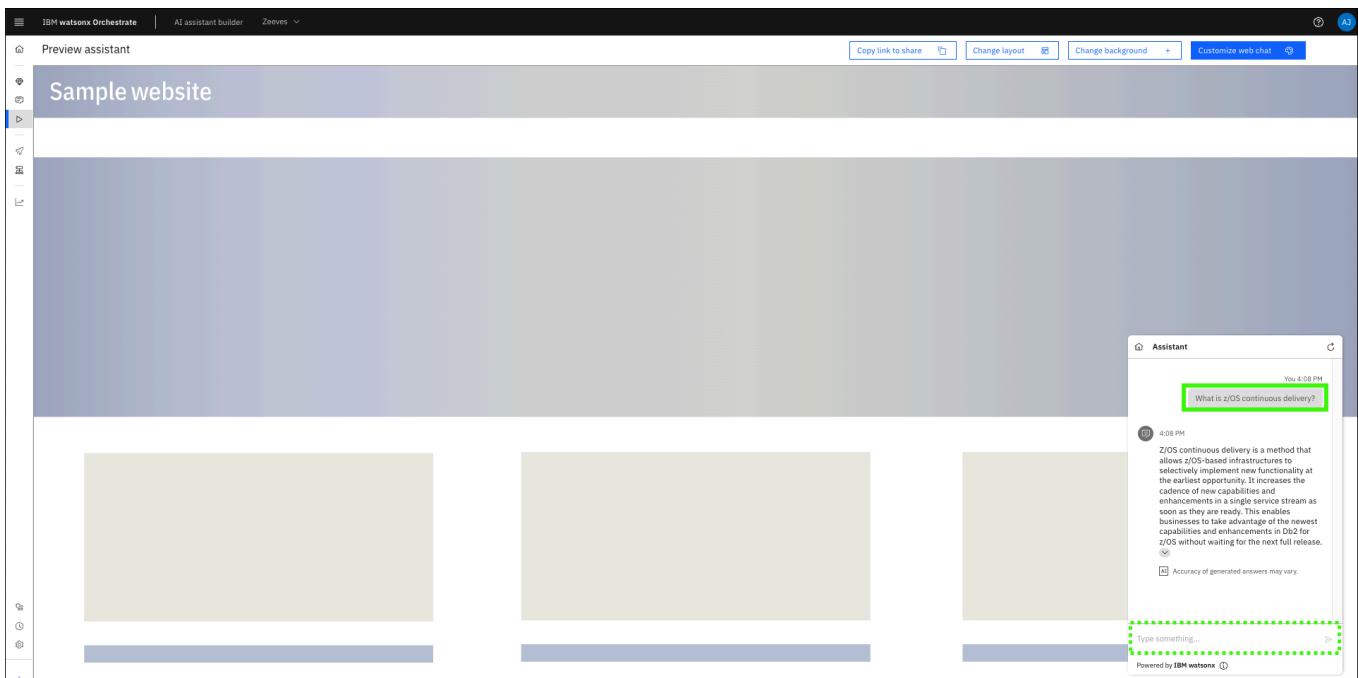

1. Hover over the **Home** (⌂) icon and click **Preview**.

2. Click the **Restart conversation** (⟳) icon.

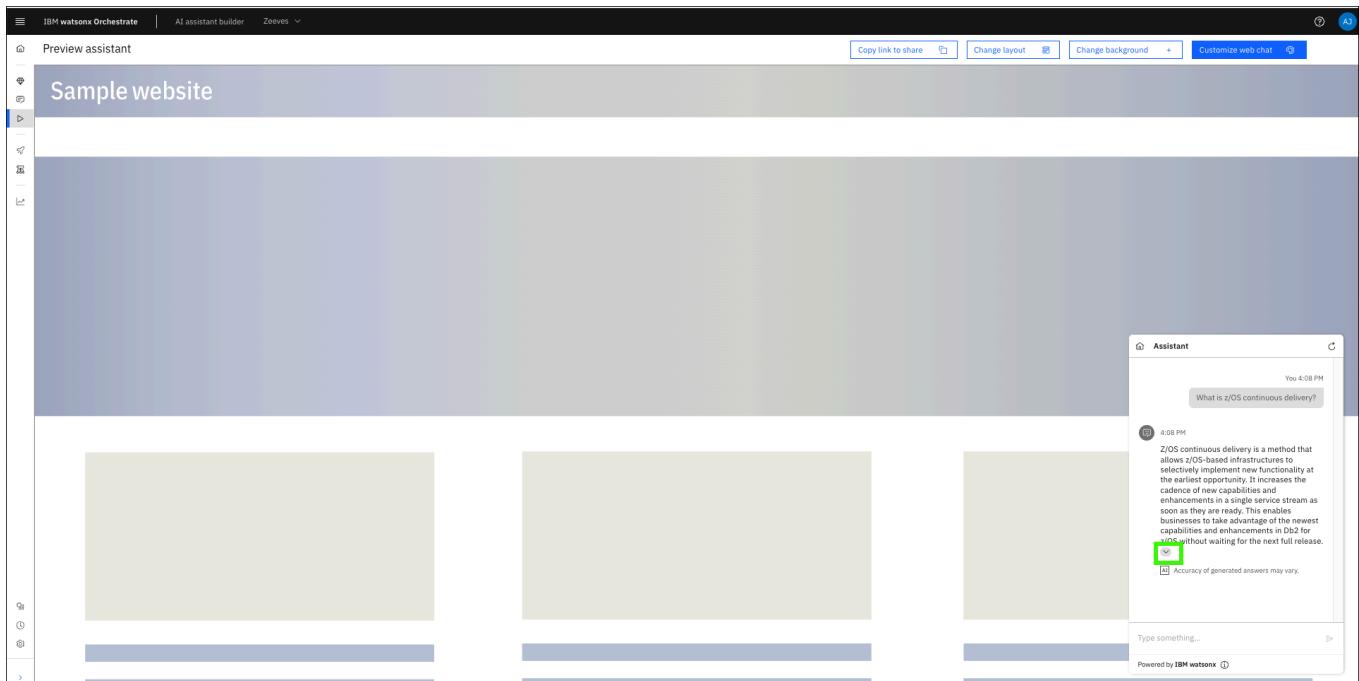

3. Enter the following prompt in your assistant.

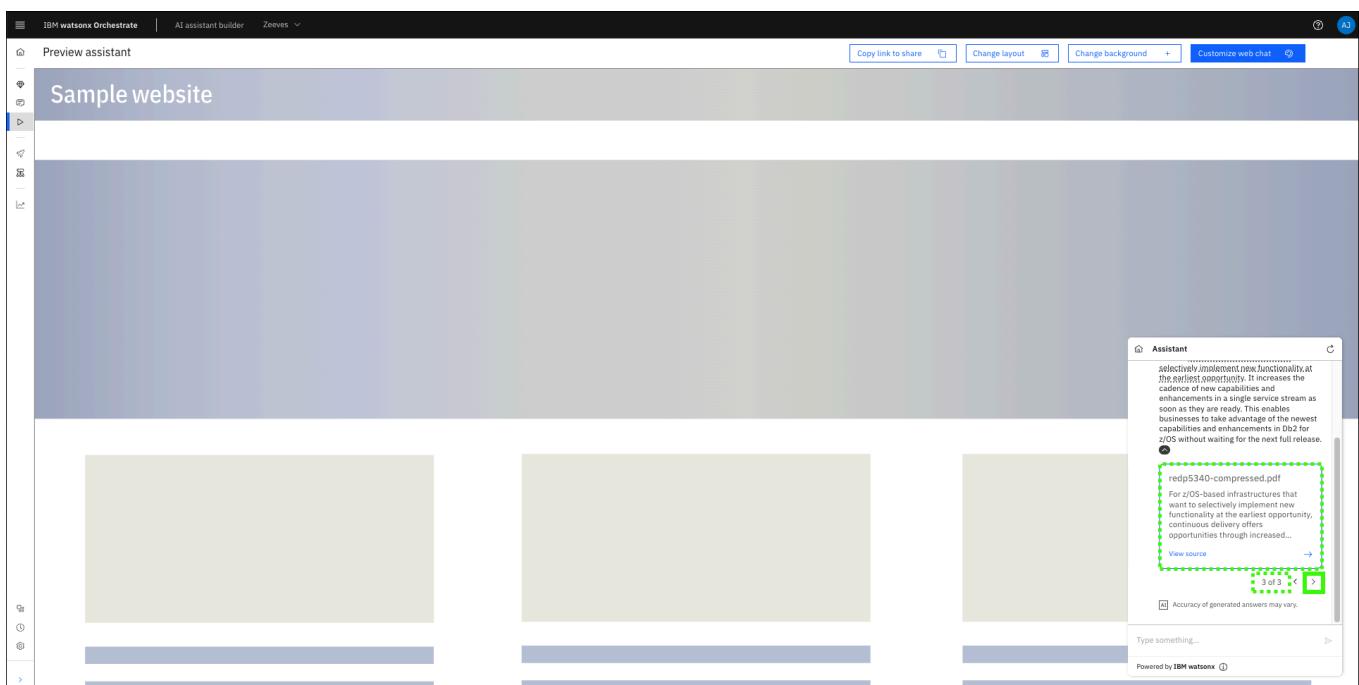

What is z/OS continuous delivery?

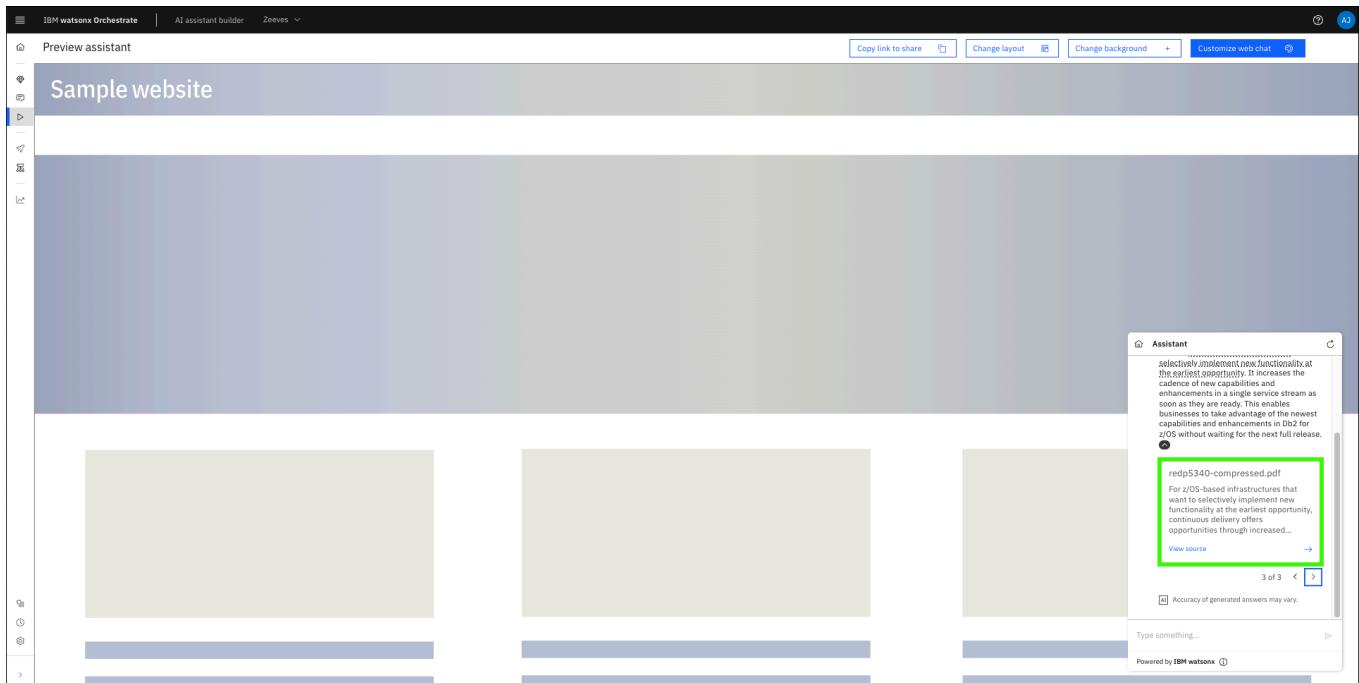

4. Clicking the Down arrow (↴).

5. Click through the list of resources and find the reference to the Red Piece document you ingested.

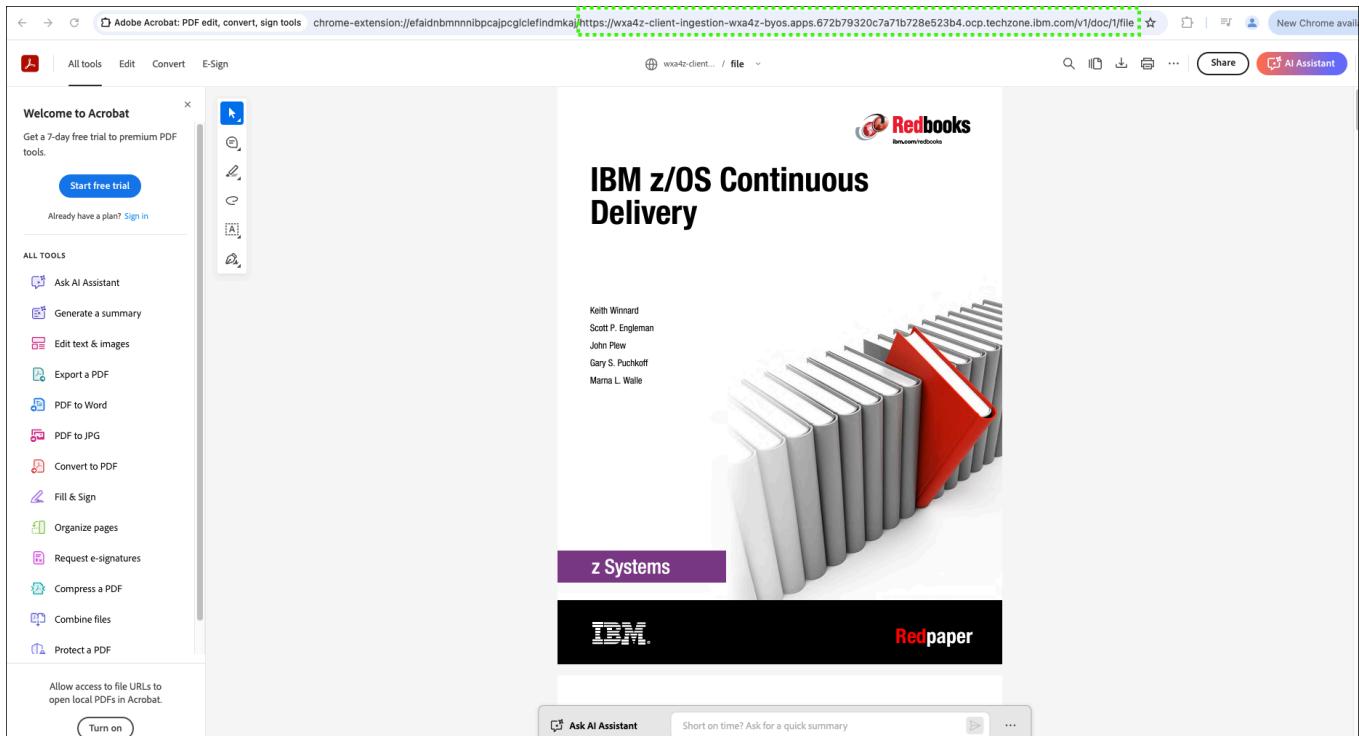

6. Click the ingested document reference.

7. Accept the security risk to view the source document.

The steps to accept the security risk for the document are not shown. The risk occurs because the certificate for the connection to the SNO instance is not secure. Notice that the URL contains the path to your SNO instance route.

You are encouraged to experiment with the metadata field! Try setting the metadata field to the following, which weights ingested docs higher than the product docs. Note, if the sample metadata below includes the IBM Redbooks:

```
{"doc_weight":  
{"product_docs":0.2,  
"customer_docs":0.8},  
"ibm_indices": "*_ibm_docs_slate,*_ibm_redbooks_slate",  
"standardize":true,  
"customer_indices":"customer_*"  
}
```

After you have configured all the settings for Conversational Search on the page, be sure to click **Save** in the upper-right of the page.

For client pilots

If you or your client have other documents to ingest, you can do so by repeating the steps using zassist. The Velocity Pilot ITZ environment is limited in compute and storage capacity. The following limits should be adhered to:

- Loading documents can take a long time, especially with > 100 MB of text.
- It is recommended to run large loads late at night.
- When loading, ensure your workstations does not sleep during the process.
- If you receive a **batch time error**, set the batch size to a lower number for that command. For example:

```
zassist ingest . -s 50
```

After ingesting all your additional documents, proceed to the next section to learn about adding skills to your assistant.

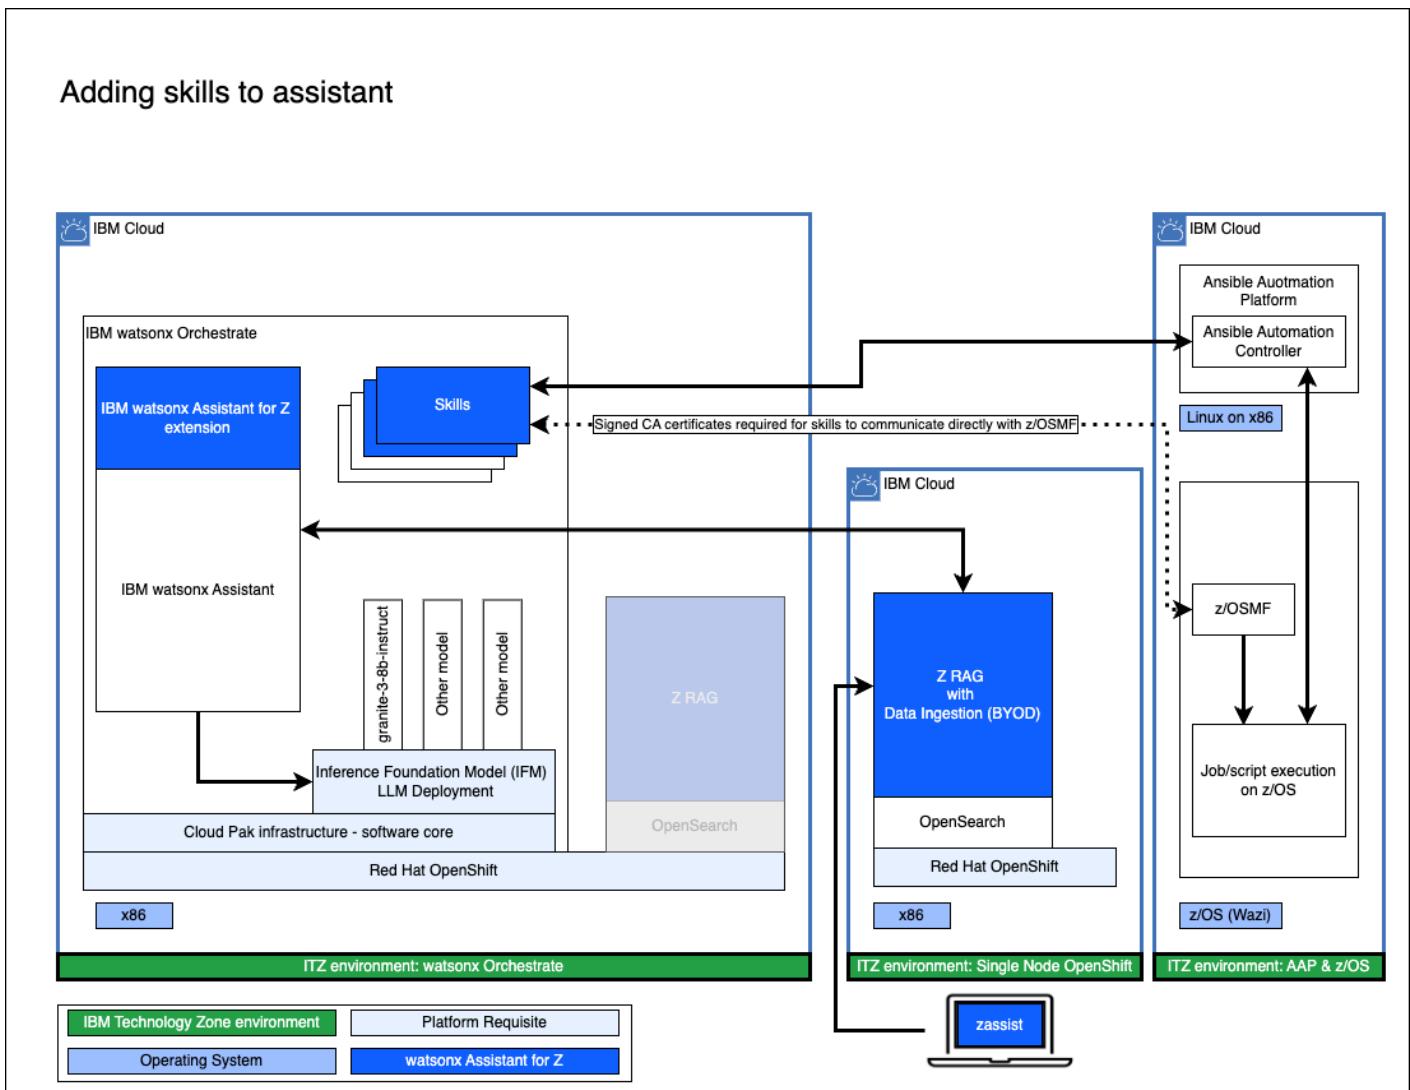

Adding skills to the assistant

Getting started with skills and actions

Watsonx Assistant for Z automates a range of IBM Z related tasks through assistant interactions by importing skills. Each skill is a pre-defined automation that accomplishes some unit or units of work by running tasks. For example, skills can view z/OS IPL information or work with z/OS datasets.

Watsonx Assistant for Z extends Watsonx Orchestrate, allowing users to build new skills from Ansible Automation platform or z/OS Management Facility (z/OSMF) through the Z Skills Accelerator extension. This extension connects Ansible and z/OS application programming interfaces (APIs) and imports automation as Ansible Playbooks, JCL, or REXX as skills. Learn more importing and building skills [here](#).

Below is a high-level, logical architecture of the environment you will deploy in this section.

Environments

Watsonx Orchestrate

The Z Skills Accelerator extension is already configured in your watsonx Orchestrate IBM Technology Zone (ITZ) environment. You can use this component to import new skills.

Ansible Automation Platform and Wazi as a Service

To import skills for automations, you use Ansible Automation Platform (AAP) and Wazi as a Service (Wazi aaS) to serve as the z/OS back-end. Learn more about AAP [here](#). Learn more about Wazi, [here](#).

The two resources are provisioned together in the ITZ environment that you reserved earlier. This environment enables the ability to manage and automate z/OS tasks and subsystems with various preinstalled ansible playbooks. It includes a z/OS back-end (Wazi as a Service) with all needed prerequisites.

The playbooks provided cover various use cases for automating z/OS management. Ansible's capabilities for automating various Z-specific tasks are not limited to the use cases that are preinstalled in the AAP instance. The preinstalled playbooks are tasks from the 'IBM z/OS core collection'. Using this environment accelerates the ability to showcase the value of watsonx assistant for Z, and to get started with simple automations that can be expanded.

The ITZ environment gives you access to AAP, which is preconfigured to target the accompanying z/OS Wazi system, along with web-based access to AAP to experiment with different playbook templates. These templates are imported into watsonx Orchestrate as skills and connected to your assistant.

For more information on the AAP and Wazi z/OS environments, refer to this [document](#).

The playbook templates that are preinstalled in AAP cover various use cases, which you can explore, including:

- z/OS Certificate Management (create, delete, list, and renew certificates)
- dataset management (create, delete, fetch datasets)
- Submit JCL
- Run Operator commands
- Run TSO commands
- And more

Each of the sections that follow build upon each other. Complete each to successfully enhance your assistant by starting with [Explore Ansible Automation Platform](#).

Explore Ansible Automation Platform

After you reserved the Ansible Automation Platform (AAP) and Wazi z/OS environment in IBM Technology Zone (ITZ) and the reservation is in the **Ready** state, follow these steps to explore AAP.

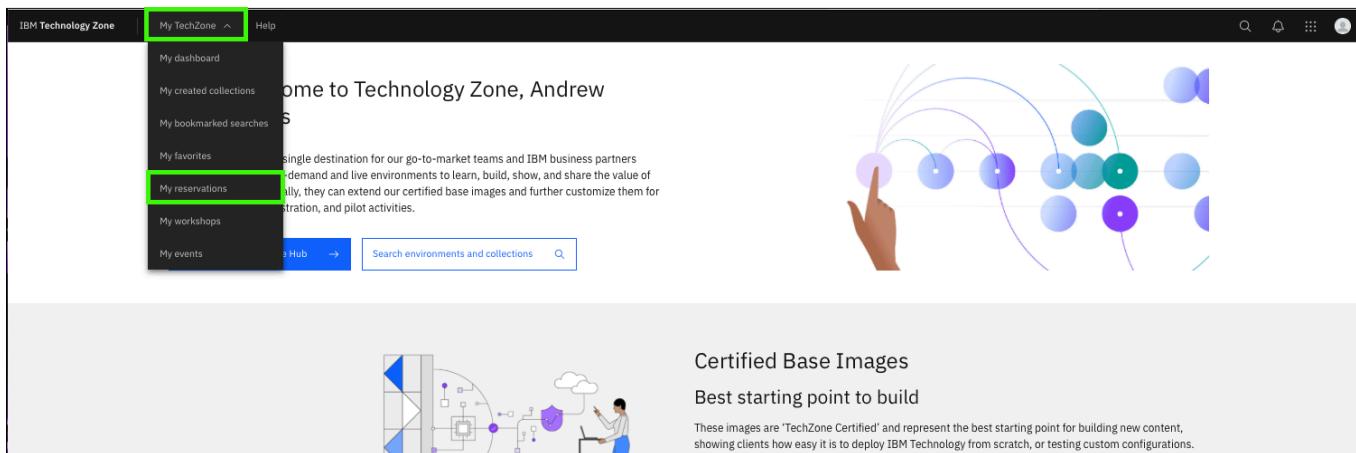

Access the AAP and Wazi as a Service environment

Be sure to record the information as instructed

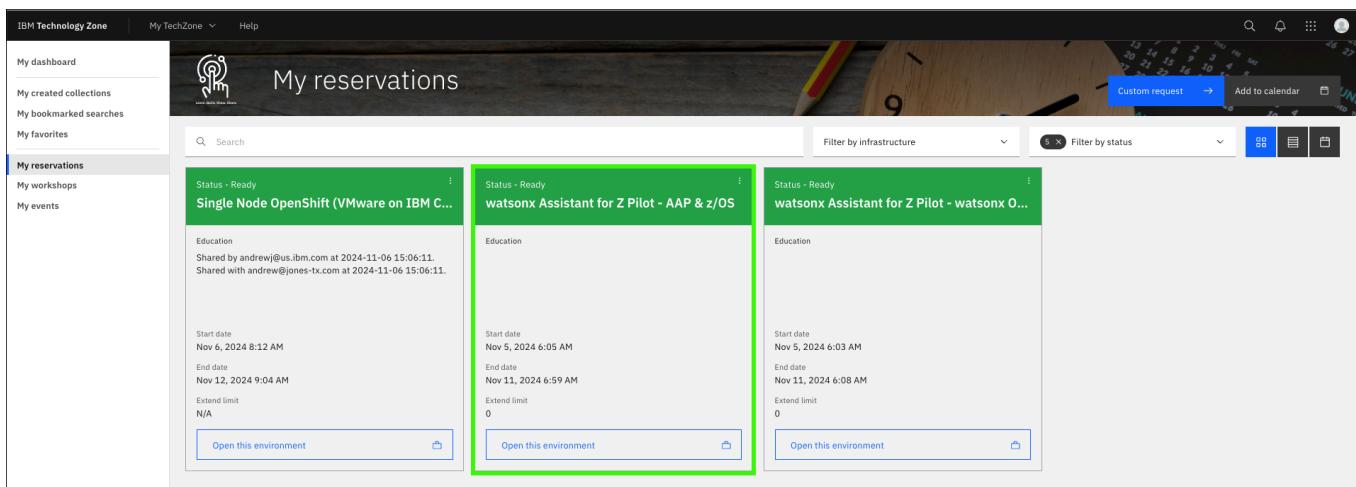

Several of the steps below instruct you to record values from your ITZ reservation. Be sure to do this as they will not only be used in this section, but also in later sections of the lab guide.

1. In the IBM Technology Zone portal, expand **My TechZone** and select **My Reservations**, or click the following link.

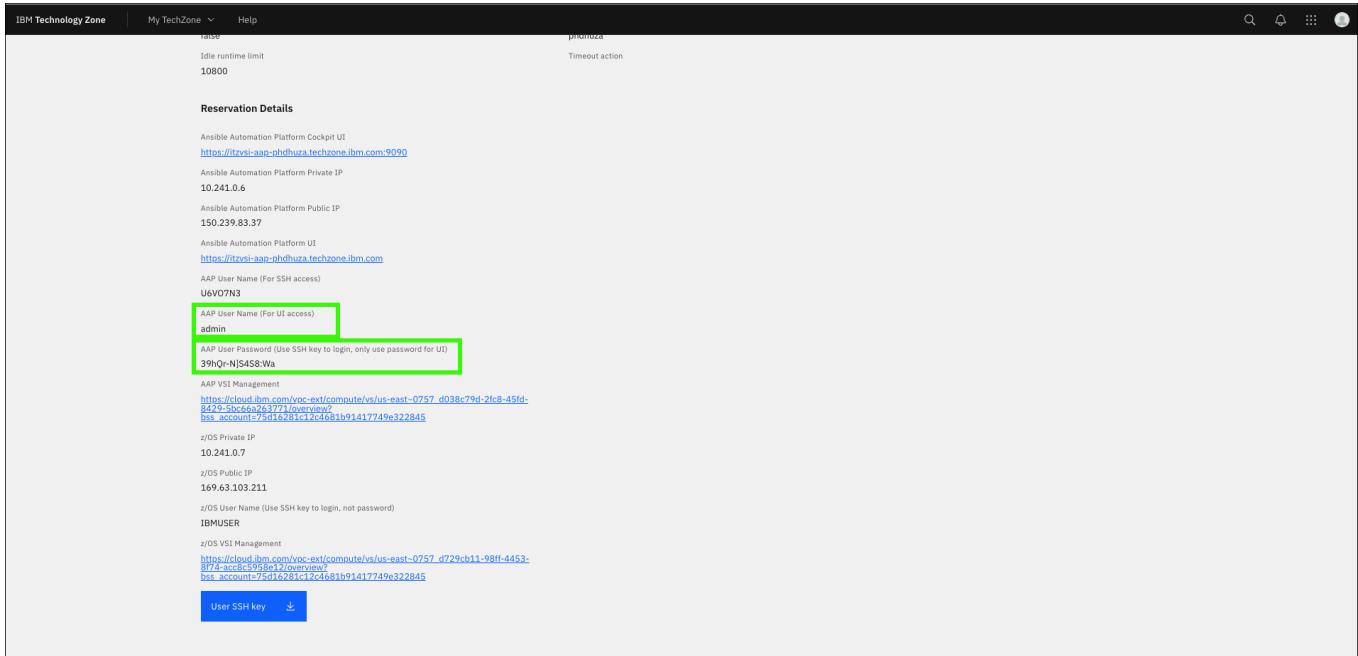

[ITZ My reservations](#)

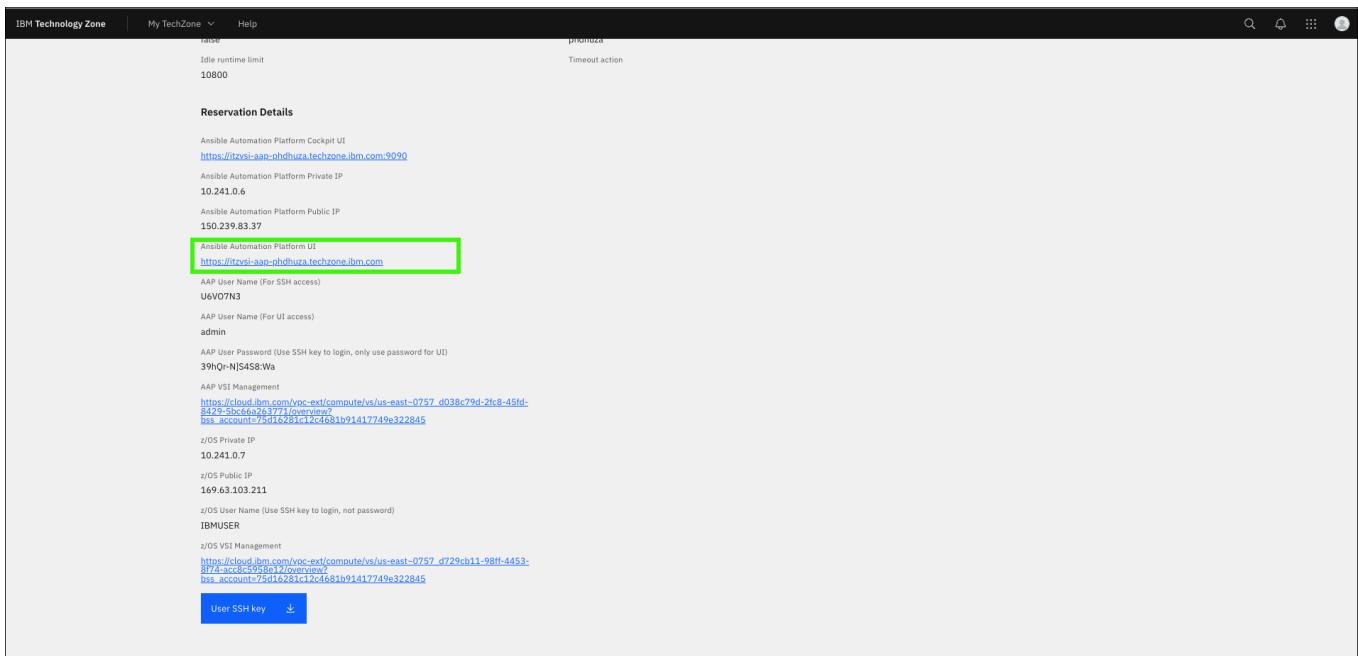

2. Click the **watsonx Assistant for Z Pilot - AAP & z/OS** tile.

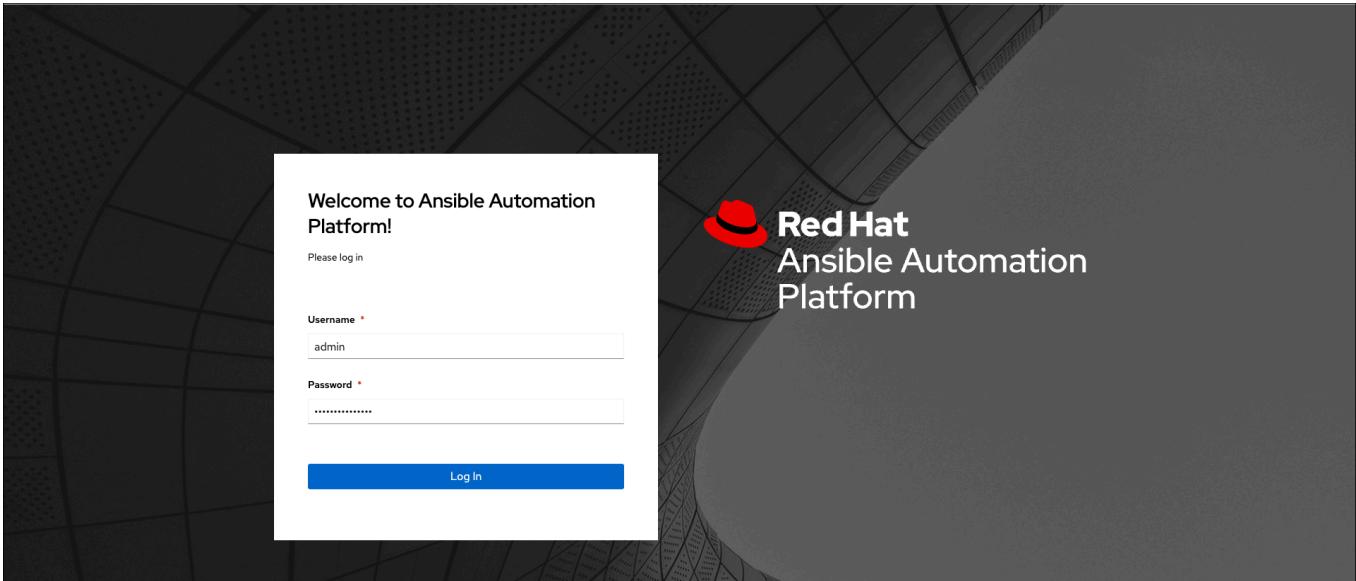

3. Locate and record the **AAP User Name (For UI access)** and **AAP User Password** fields.

4. Record and then click the Ansible Automation Platform UI link.

5. Enter the **Username** and **Password** that is recorded in step 3 and click **Log In**.

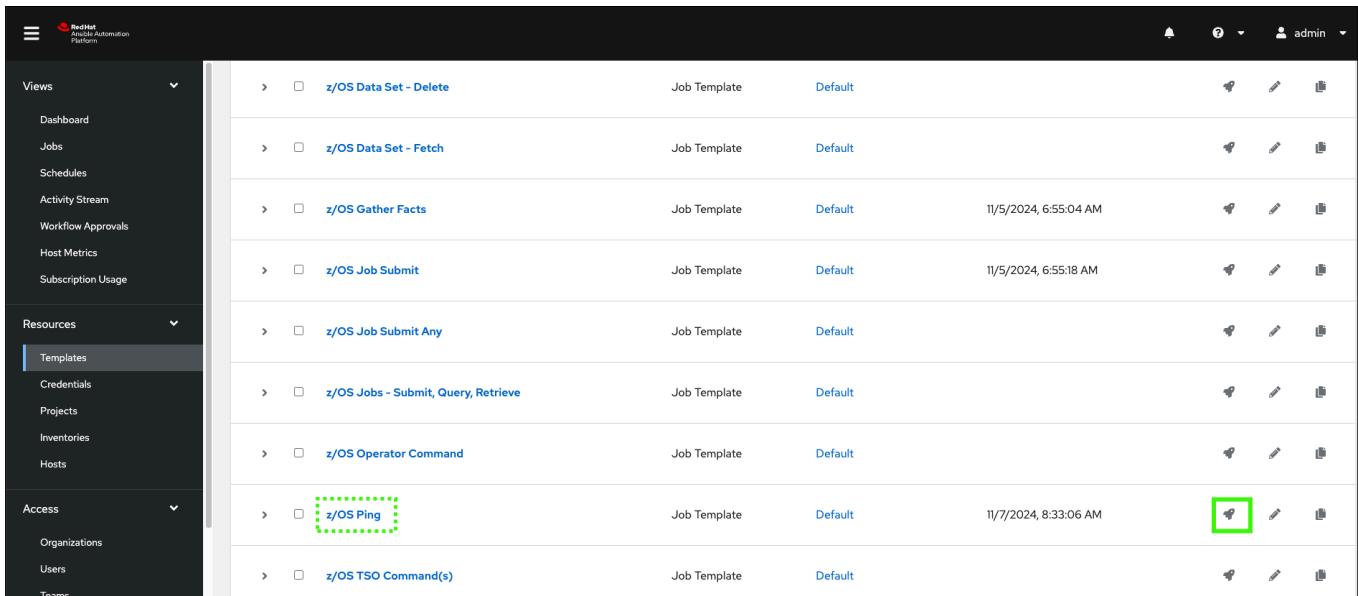

6. Click **Templates** under the **Resources** section.

The screenshot shows the Red Hat Ansible Automation Platform (AAP) interface. The left sidebar has a 'Views' dropdown, followed by a list of sections: Dashboard, Jobs, Schedules, Activity Stream, Workflow Approvals, Host Metrics, Subscription Usage, Resources (with 'Templates' selected), Credentials, Projects, Inventories, Hosts, Access (with 'Organizations', 'Users', and 'Teams'), and Administration. The main area is the 'Dashboard', which includes a header message about a tech preview of the new user interface, a summary of system status (3 Hosts, 0 Failed hosts, 2 Inventories, 0 Inventory sync failures, 4 Projects, 0 Project sync failures), and a 'Job Runs' chart. The chart shows job runs from October 7th to November 17th, with a significant spike peaking around November 15th.

The AAP instance is preconfigured to the Wazi aaS instance

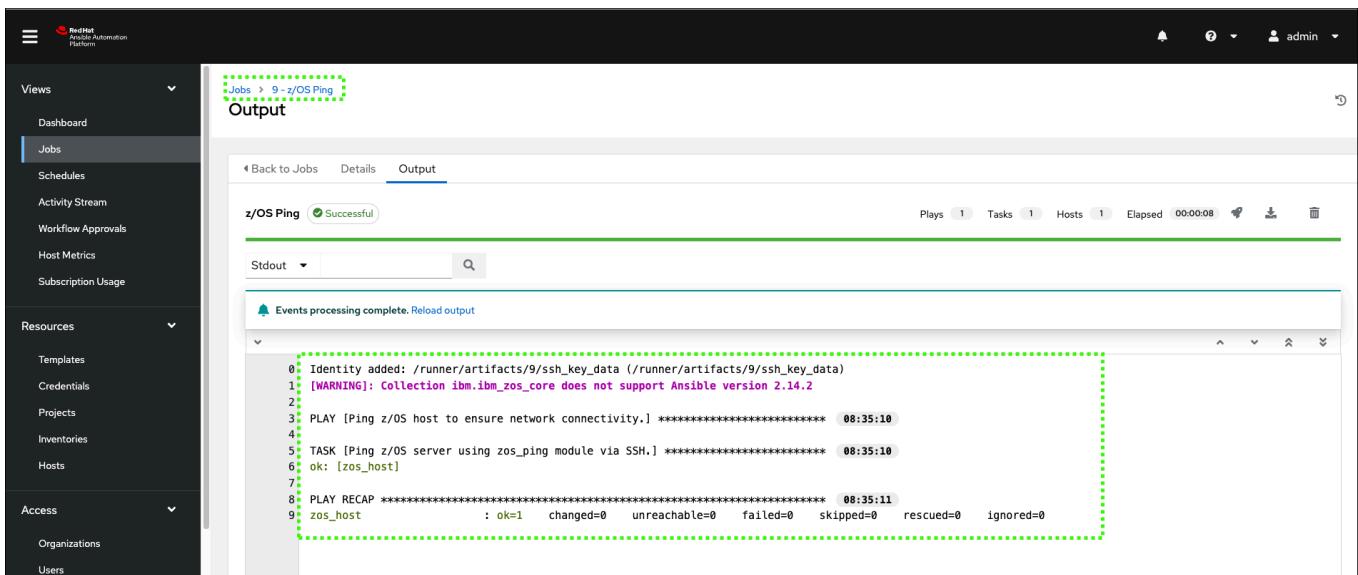

Note that because the AAP instance and the back-end z/OS system are preconfigured, no changes are needed to execute the templates and they will target your provisioned z/OS system by default.

7. Locate the **z/OS Ping** template and click the rocket () icon to start the template.

Views	z/OS Data Set - Delete	Job Template	Default			
Dashboard	z/OS Data Set - Fetch	Job Template	Default			
Schedules	z/OS Gather Facts	Job Template	Default	1/5/2024, 6:55:04 AM		
Activity Stream	z/OS Job Submit	Job Template	Default	1/5/2024, 6:55:18 AM		
Workflow Approvals	z/OS Job Submit Any	Job Template	Default			
Host Metrics	z/OS Jobs - Submit, Query, Retrieve	Job Template	Default			
Subscription Usage	z/OS Operator Command	Job Template	Default			
Resources	z/OS Ping	Job Template	Default	1/7/2024, 8:33:06 AM		
Templates	z/OS TSO Command(s)	Job Template	Default			
Credentials						
Projects						
Inventories						
Hosts						
Access						
Organizations						
Users						
Teams						

8. Observe the z/OS Ping job run.

Jobs > 9 - z/OS Ping

Output

Events processing complete. Reload output

```

0 Identity added: /runner/artifacts/9/ssh_key_data (/runner/artifacts/9/ssh_key_data)

```

Take time to explore the other templates that are ready to use. Learn more about the automation capabilities [here](#).

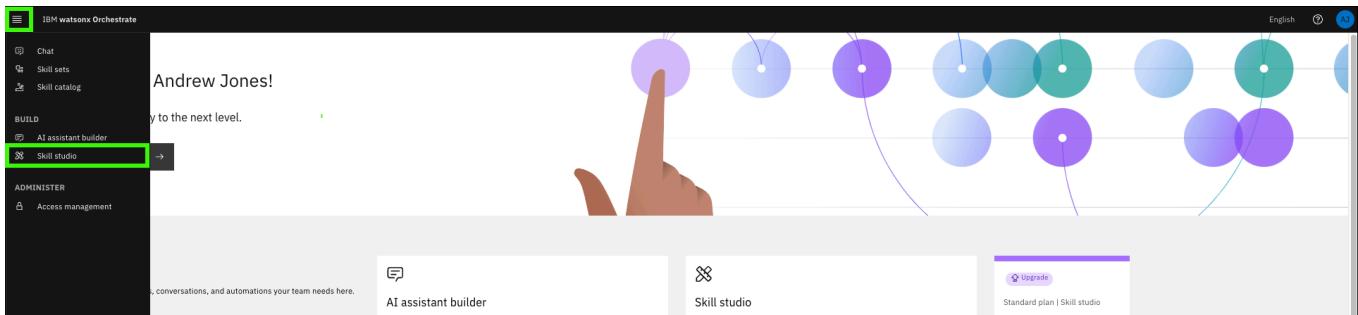

Importing skills from Ansible Automation Platform

Now that you understand Ansible Automation Platform (AAP) and the preinstalled automations available, you can import them as skills into your watsonx Orchestrate instance, which is used for assistant guided actions.

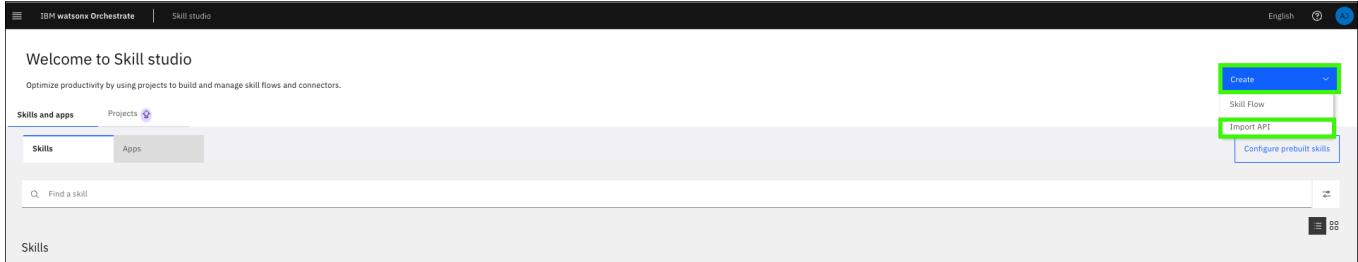

Import skills into your assistant

The next steps assume that you have an active browser window to the watsonx Orchestrate ITZ cloud account. If you do not, refer to the initial steps in [Creating an assistant and configuring conversational search](#).

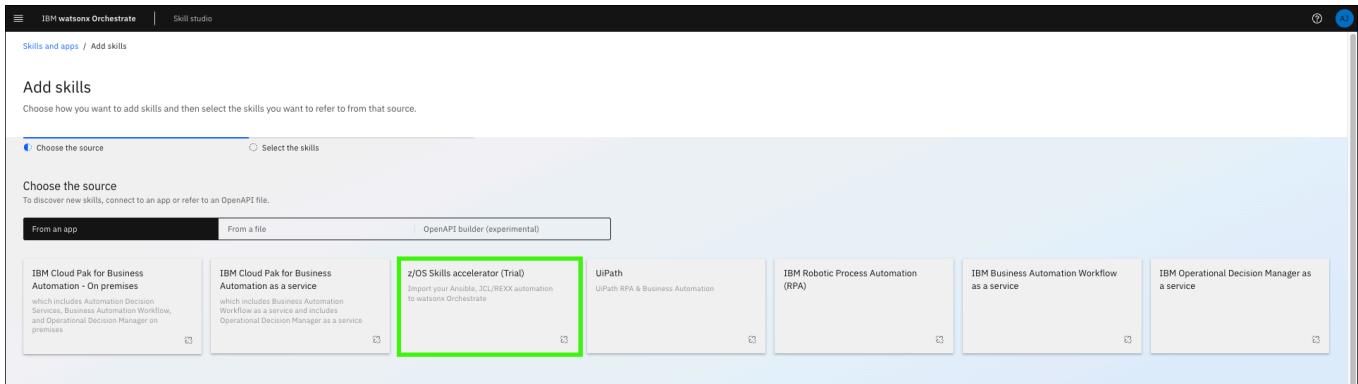

1. Return to your watsonx Orchestrate instance and expand the main menu and click **Skill studio**.

2. Expand **Create** and click **Import API**.

3. Click the **z/OS Skills accelerator (Trial)** tile.

4. Enter the following values in the **z/OS Skills accelerator** form and then click **Connect**.

Use the **URL**, **User Name**, and **Password** values recorded in the [Explore Ansible Automation Platform](#) section earlier.

a: Connection Type: ansible

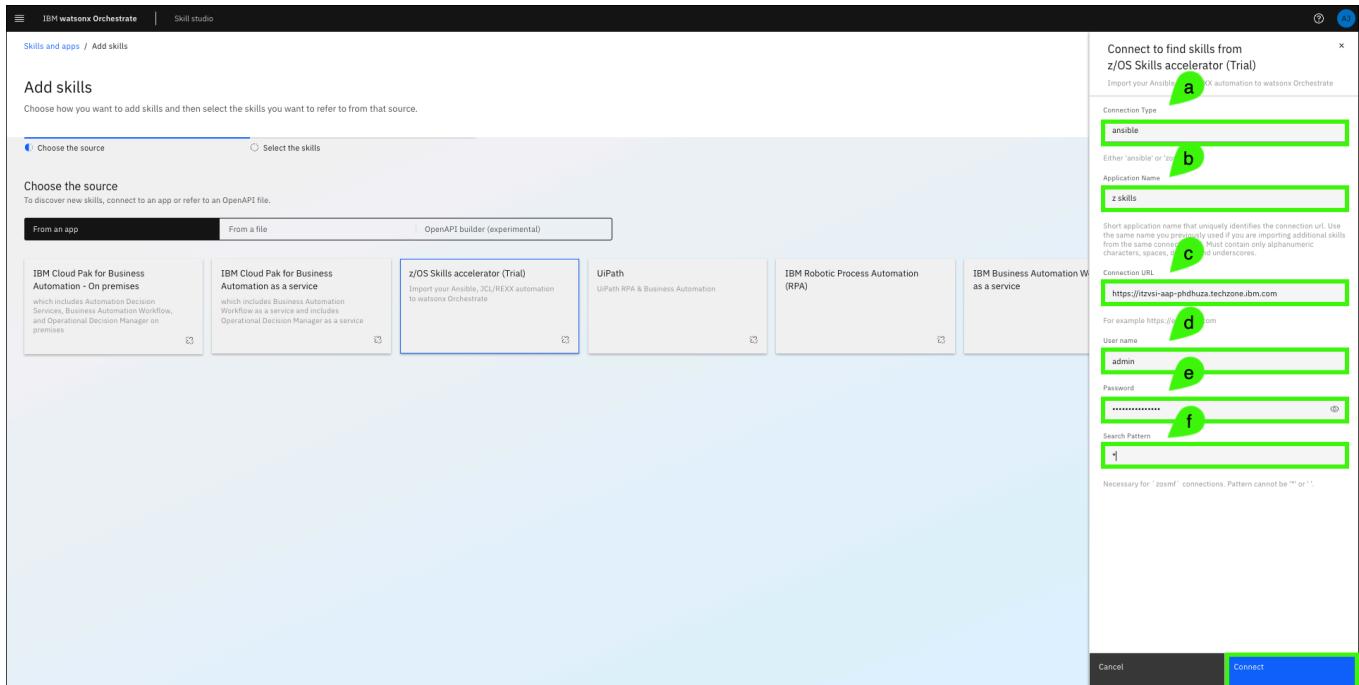

b: Application Name: <enter a meaningful name for the skills that you will import> - *be sure to remember this name, you will need in the next section*

c: Connection URL: <enter the URL for your AAP UI>

d: User Name: <enter the AAP User Name (for UI access)>

e: Password: <enter the AAP User Password>

f: Search Pattern: *

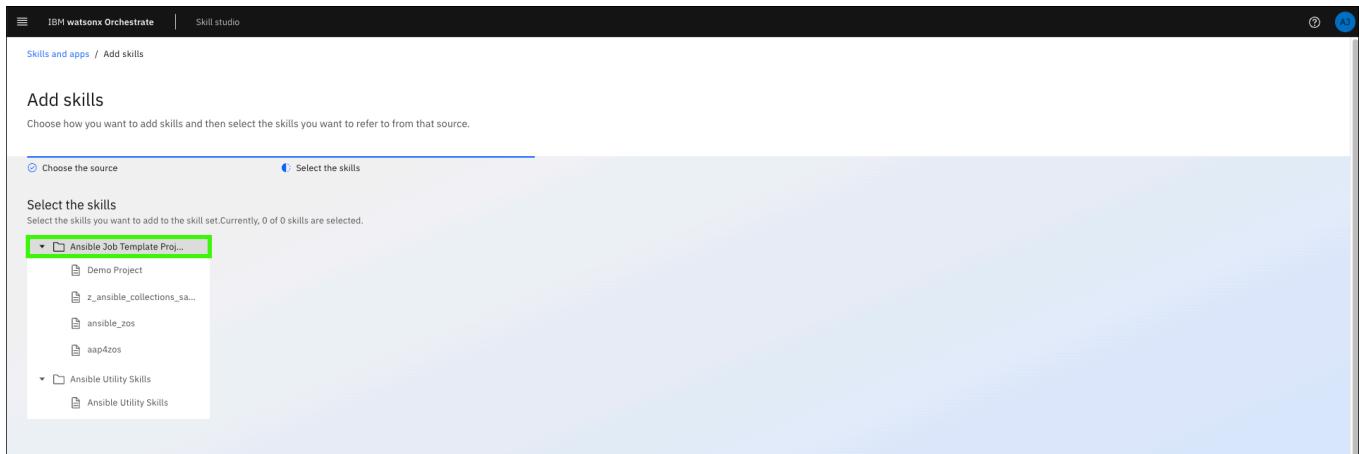

5. Expand the Ansible Job Template Proj... folder.

Explore the other available skills

Take time to explore the available skills. There are many utility skills provided out of the box with the “Z Skills Accelerator” which are needed for actions such as retrieving the output of an Ansible skill. Consider importing these utility skills to enable more complete automation execution flows.

6. Click **aap4zos**.

Skill	Description	Status
Z/os ping	Z skills - this playbook pings...	Ready to add

z/OS Ping	Just 1 step away to be ready	Ready to publish	Imported	andrew@jones-tx.com	November 19 2024

The selected skills are now ready for use and available to your assistant. In the next section, learn how to connect them to your assistant.

Connecting skills to your assistant

Once you have a subset of skills published, the application you created can be connected to your assistant.

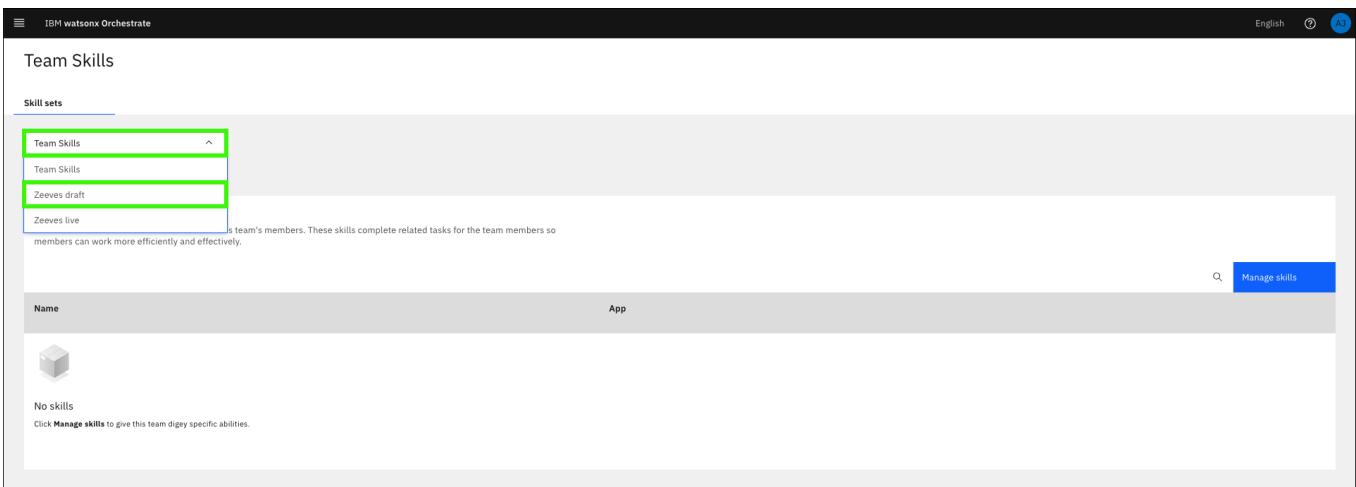

1. Expand the main menu and select **Skill sets**.

The screenshot shows the IBM Watsonx Orchestrate interface with the 'Skill studio' tab selected. The left sidebar has 'Skill sets' highlighted with a green box. The main area displays a table of published skills:

Step in the process	Status	Skill type	Author	Last edited
Ready to use	Published	Imported	andrew@jones-tx.com	November 19 2024
Ready to use	Published	Imported	andrew@jones-tx.com	November 19 2024
Ready to use	Published	Imported	andrew@jones-tx.com	November 19 2024

2. Click the **Team Skills** drop-down and select the **Draft** of your assistant.

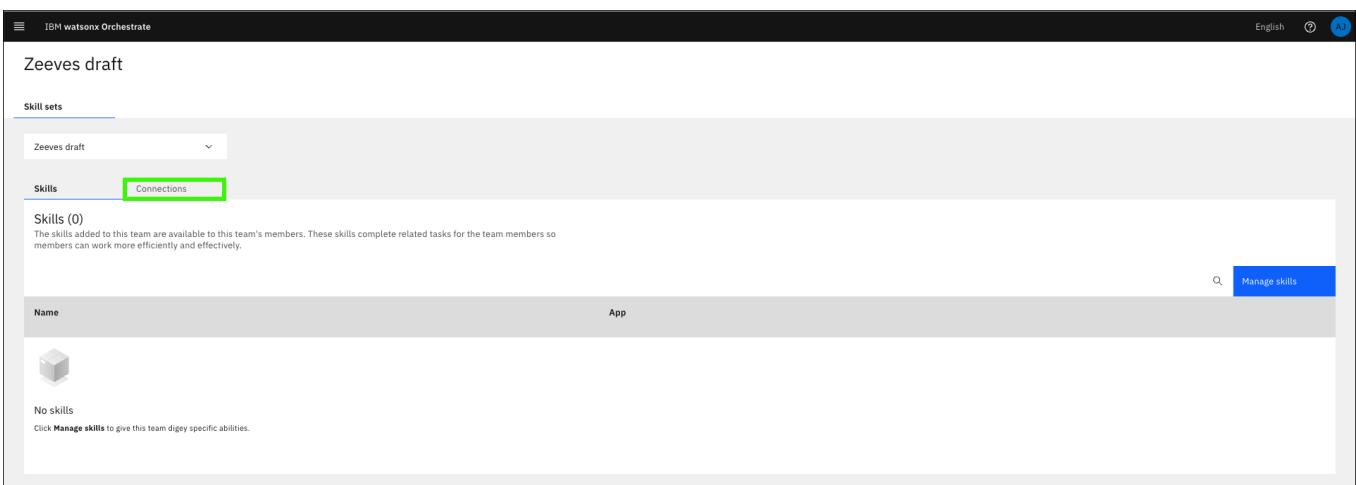

The screenshot shows the 'Team Skills' page. The 'Skill sets' dropdown is open, showing 'Team Skills' selected. Below it, 'Zeeves draft' is highlighted with a green box. The main area shows a table with one row:

Name	App

Text at the bottom says: 'No skills. Click **Manage skills** to give this team digest specific abilities.'

3. Click the **Connections** tab.

The screenshot shows the 'Zeeves draft' connections page. The 'Skills' tab is selected. Below it, the 'Connections' tab is highlighted with a green box. The main area shows a table with one row:

Name	App

Text at the bottom says: 'No skills. Click **Manage skills** to give this team digest specific abilities.'

4. Click the **Search (🔍)** icon.

Continue to the next section to create actions for your assistant.

Creating actions for your assistant

Once the skills in your application are connected to your assistant, you're ready to begin creating actions tied to those skills. Learn more about building actions [here](#)

Configure the number of input fields

Before configuring actions, it's important to modify a setting within watsonx Orchestrate that allows triggered skills to display as forms (versus conversational skills).

1. Click your (a) profile icon and then click (b) **Settings**

Learn more about configuring input fields [here](#).

The screenshot shows the IBM Watsonx Orchestrate web interface. At the top, there's a navigation bar with a profile icon and some settings. Below it, the main area is titled 'Zeeves draft' under 'Skill sets'. There are tabs for 'Skills' and 'Connections', with 'Skills' being active. A search bar shows 'z skills'. Below the search is a table with one row, 'Ansible Controller Skills - z skills', which has 2 skills, is connected by 'Team', and is connected by 'andrew@jones-tx.com'. On the right side, there's a sidebar with options like 'Region', 'Plan', 'Provide feedback', 'Privacy', 'About', and 'Log out'. The 'Settings' option is highlighted with a green box and a callout bubble labeled 'b'. The user profile icon in the top right is also highlighted with a green box and a callout bubble labeled 'a'.

2. Click the **Skill configurations** tab.

This screenshot shows the 'Settings' page in the IBM Watsonx Orchestrate interface. The 'Skill configurations' tab is active and highlighted with a green box. Other tabs available are 'Data Retention' and 'Platform languages'. The main content area is titled 'Skill configurations' and contains a note: 'Set default for maximum number of fields to consider a skill to be conversational'. Below this is a text input field labeled 'Number of form fields' with the value '0', which is also highlighted with a green box. There are minus and plus buttons next to the input field.

3. Enter 0 for the **Number of form fields**.

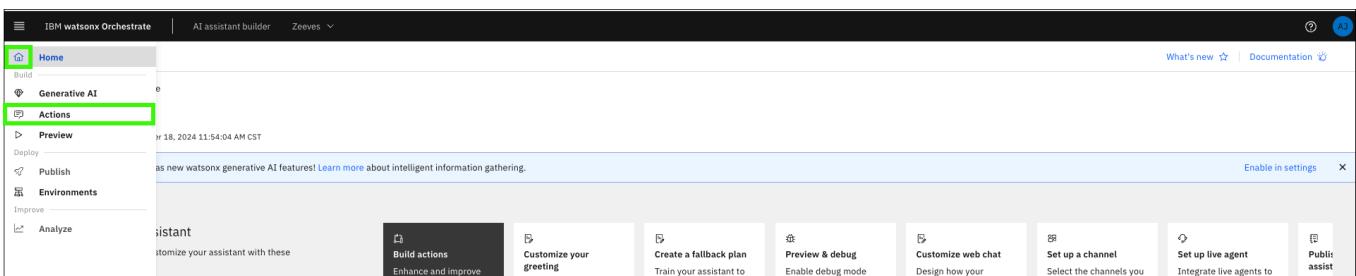

This screenshot is identical to the previous one, showing the 'Settings' page with the 'Skill configurations' tab selected. The 'Number of form fields' input field now contains the value '0', indicating that the user has completed step 3.

Create actions

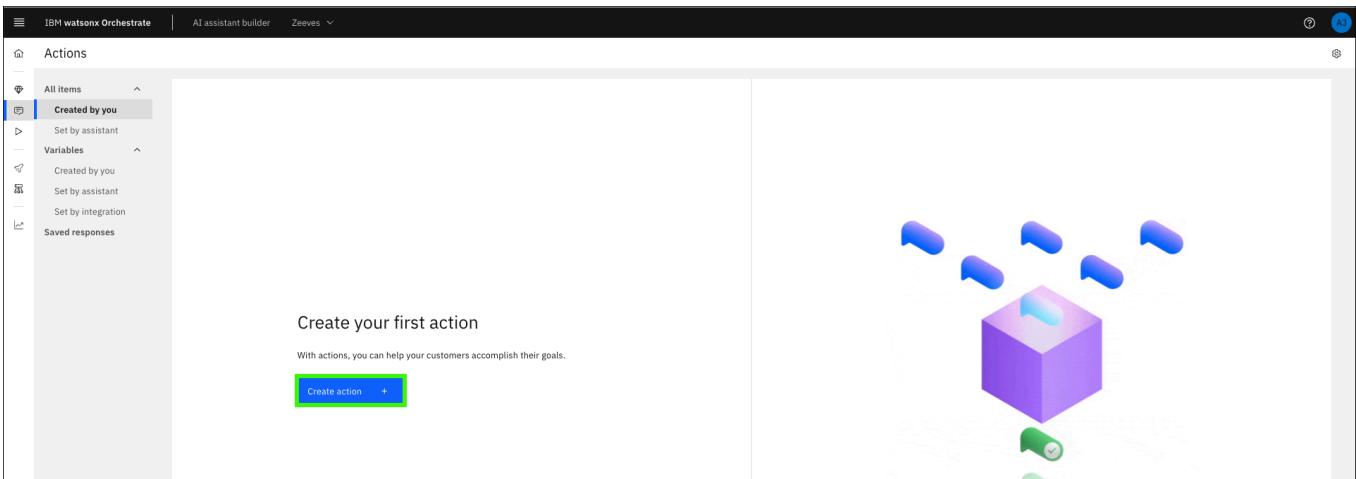

1. Click the main menu and select **AI assistant builder**.

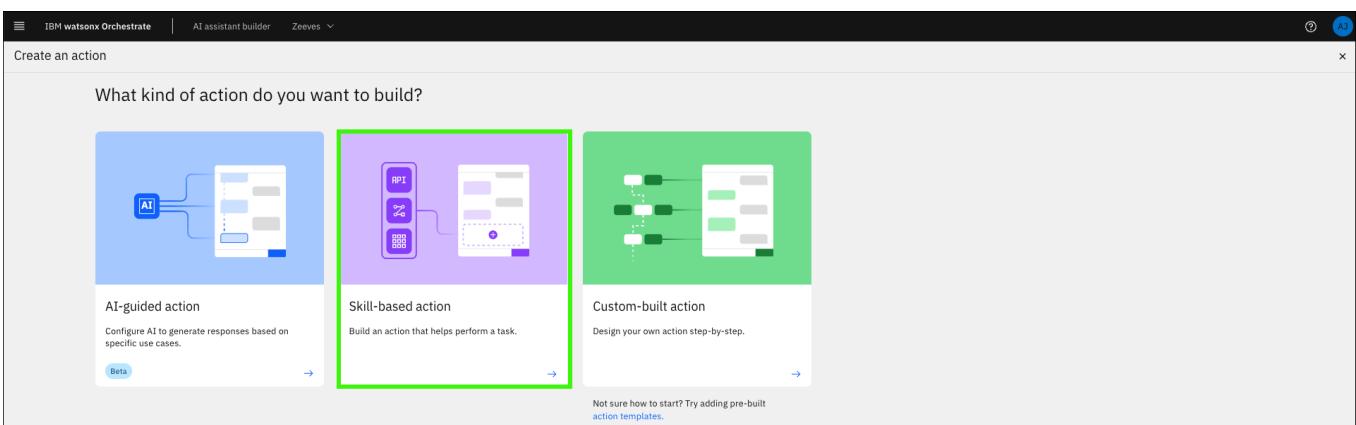

2. Hover over the **Home** icon (🏠) and click **Actions**.

3. Click **Create action**.

4. Click the **Skill-based action** tile.

5. Select the **z/OS Gather Facts** tile and click **Next**.

Note, it may take a minute for the page to display the action tiles. The date shown in the **z/OS Gather Facts** tile reflects when you added the skill to your application.

The screenshot shows a list of actions under the heading "Build an action from a skill". The "Select a skill" section says "Choose a conversational skill published as a foundation of your action." A search bar is present. The grid contains the following tiles:

- z/OS Ping**: Last updated: 2024-11-19T15:58:20.567Z
- z/OS Gather Facts**: Last updated: 2024-11-19T15:56:26.843Z (highlighted)

- On the **New action** dialog, (a) enter a prompt a user of the assistant might use to initiate the action and then (b) click **Save**.

Be careful with the sample phrases you specify.

During the development of the lab guide, it was discovered that some sample phrases with a `/` character can cause issues with the actions. Avoid using `z/OS` in your sample phrases. This issue has been reported to the offering team.

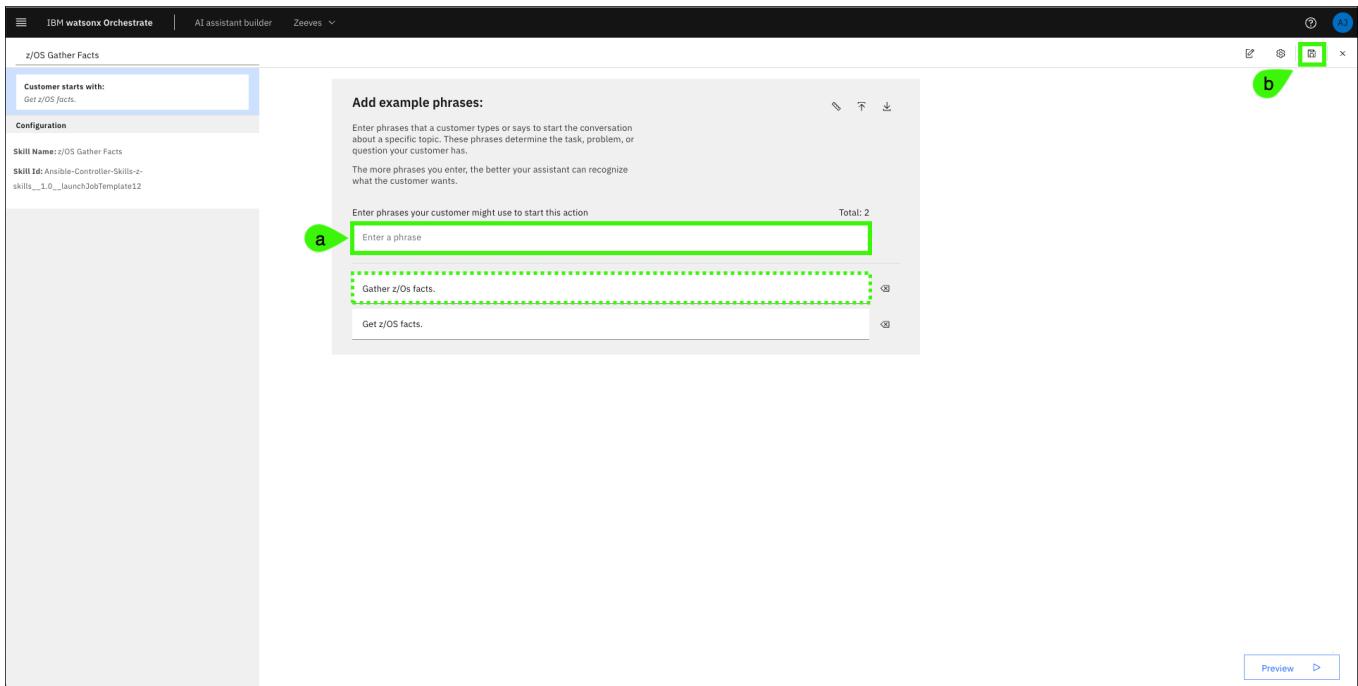

Sample prompts:

Get zOS facts

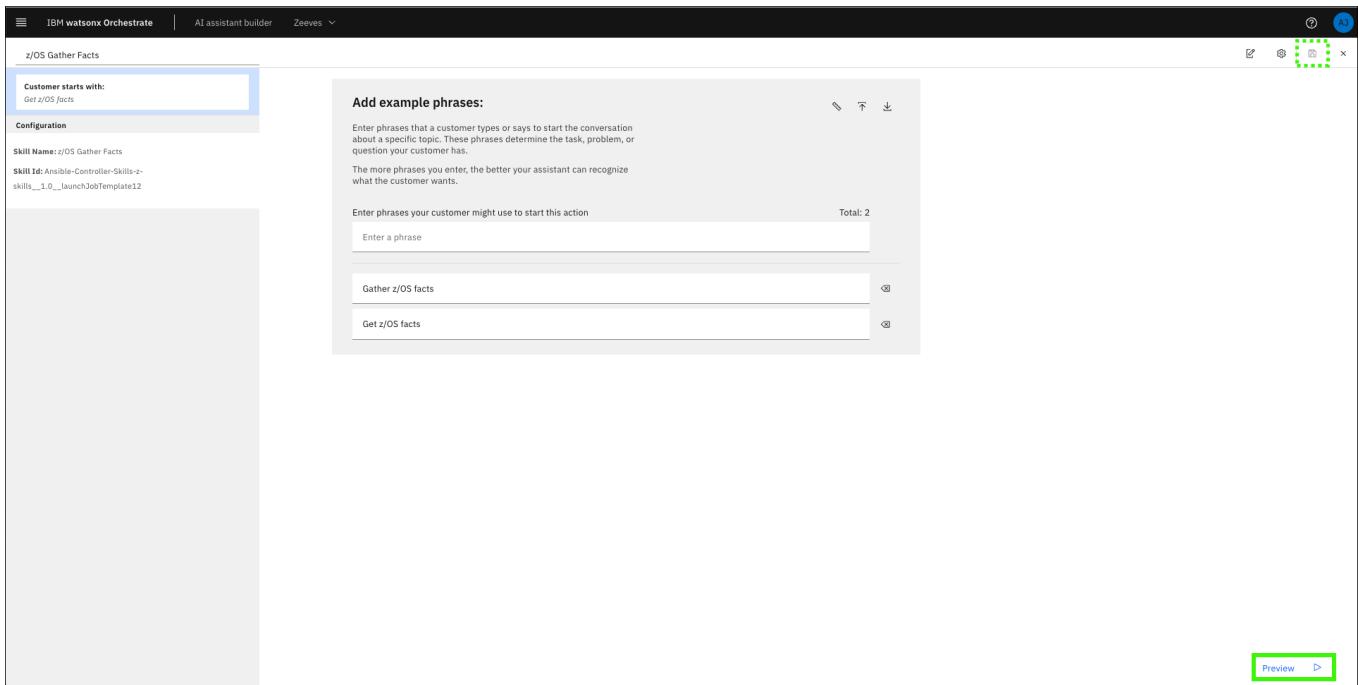

Gather zOS facts

The screenshot shows the "New action" dialog. The "Customer starts with:" field contains "Example: I want to pay my credit card bill.". The "Add example phrases:" section has a note: "Enter phrases that a customer types or says to start the conversation about a specific topic. These phrases determine the task, problem, or question your customer has. The more phrases you enter, the better your assistant can recognize what the customer wants." Below is a text input field with placeholder "Enter phrases your customer might use to start this action" and "Total: 0". The input field contains "Example: I want to pay my credit card bill." A green callout labeled 'a' points to this input field. A green callout labeled 'b' points to the "Save" button at the bottom right of the dialog.

- Add any (a) additional prompts and then (b) click the save ().

8. Click Preview.

9. Enter one of the prompts you specified in step 9 or 10.

Prompt:

Get zOS facts

Customer starts with:
Get z/OS facts

Add example phrases:

Enter phrases that a customer types or says to start the conversation about a specific topic. These phrases determine the task, problem, or question your customer has.

The more phrases you enter, the better your assistant can recognize what the customer wants.

Enter phrases your customer might use to start this action
Total: 2

Enter a phrase

Gather z/OS facts
Get z/OS facts

Preview

12:55 PM
Greet customer [default]

Welcome, how can I assist you?

Get z/OS facts

10. Review the returned results and record the job number.

In the execution of this skill-based action, the skill executed properly and the output is the job id.

If an error is generated or the action is not performed and only search results are returned, review the Troubleshooting section below.

Customer starts with:
Get z/OS facts

Add example phrases:

Enter phrases that a customer types or says to start the conversation about a specific topic. These phrases determine the task, problem, or question your customer has.

The more phrases you enter, the better your assistant can recognize what the customer wants.

Verify the job in the Ansible Automation Platform console

Return to the Ansible Automation Platform (AAP) console and review the job information.

1. Click **Jobs** and then click the **job** number recorded in the previous step for the **z/OS Gather Facts** skill.

The screenshot shows the 'Jobs' page in the Red Hat Ansible Automation Platform. The left sidebar has a 'Jobs' menu item highlighted with a green box. In the main table, a row for '12 - z/OS Gather Facts' is highlighted with a green box. The table columns include Name, Status, Type, Start Time, Finish Time, and Actions.

Name	Status	Type	Start Time	Finish Time	Actions
12 - z/OS Gather Facts	Successful	Playbook Run	12/5/2024, 7:17:32 AM	12/5/2024, 7:17:41 AM	

2. Review both the **Details** and **Output** for the **z/OS Gather Facts** job.

Recall, that in the assistant, the contents shown in the **Output** of the Ansible job were not displayed.

The screenshot shows the 'Output' tab for job '12 - z/OS Gather Facts'. The output content is a playbook execution log with syntax highlighting for YAML and command-line output. A large green dotted rectangle highlights the entire output content area.

IBM watsonx Assistant for Z provides utility skills to retrieve the job output. It is also possible to create a skill flow that executes the **z/OS Gather Facts** skill followed by the **Retrieve job output** utility skill in sequence; passing the job id from the first skill to the second, in order to view the output within the assistant. Creating a skill flow is covered in the next section.

Troubleshooting

✖ Skill returns "Sorry, we're having issues generating a response" or the action is not performed and only search results are returned.

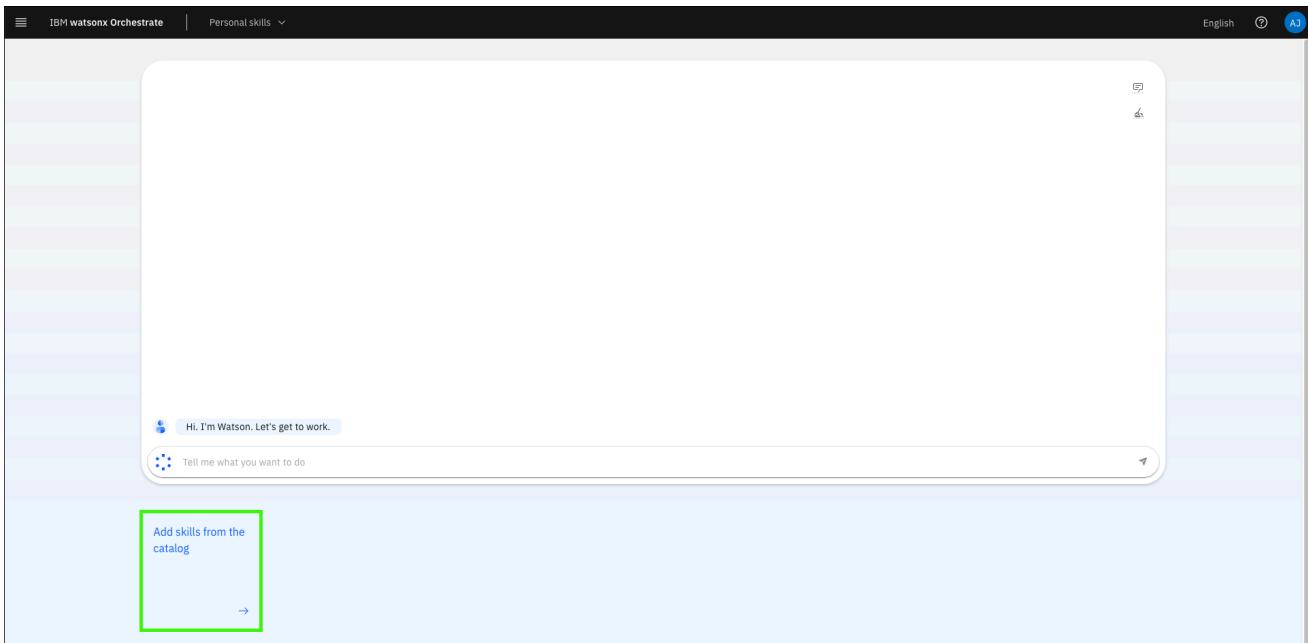

The screenshot shows the IBM Watsonx Assistant AI assistant builder interface. On the left, there's a sidebar with sections like Configuration, Customer starts with:, and Add example phrases:. Under Configuration, the Skill Name is set to "z/OS Gather Facts" and the Skill Id is "Ansible-Controller-Skills-z-skills_1.0_launchJobTemplate12". The "Customer starts with:" field contains "Get z/OS facts". The "Add example phrases:" section has two entries: "Gather z/OS facts" and "Get z/OS facts". On the right, there's a "Preview" window showing a simulated chat session. The customer says "Welcome, how can I assist you?", and the bot responds with "Gather z/OS facts". In the preview window, a green dashed box highlights the bot's response. Below the response, there are two error notifications: "Error in the response" (Details) and "Skill error" (Inspect). A note at the bottom states: "There are no additional steps for this action. Add a new step or end the action."

This error appears to be an intermittent issue when a skill is first added. To resolve, add the skill to your personal skills catalog using the steps that follow. If you encounter the issue, try the steps that follow:

1. Expand the main menu and select Chat.

The screenshot shows the main menu of IBM Watsonx Assistant. The "Chat" option is highlighted with a green box. Other menu items include "Skill sets", "Skill catalog", "AI assistant builder", "Skill studio", "Access management", and "Administrator". The "AI assistant builder" item is also highlighted with a blue box. The "Add example phrases:" section is visible on the right, showing the same configuration as the previous screenshot.

2. Click Add skills from the catalog.

3. Search for the skill app you created earlier and click the tile for your app.

The screenshot shows the "Skill catalog" page. The search bar contains "z skills". The "Apps" section displays several tiles, including "Salesloft", "Cognos", "Skill flows", "Adobe Workfront", "Webex", "IBM Process Mining", "Salesforce Chatter", "Ansible Controller Skills - z skills" (which is highlighted with a green box), "Interview top candidates using ...", "Reveal your existing applicants...", "Seismic", "FreshService", "Workday HCM", and "ZoomInfo".

4. Click **Add skill** for all the skills you want to add.

The screenshot shows the details for the "Ansible Controller Skills - z skills" app. It lists two skills: "z/OS Gather Facts" and "z/OS Ping". Each skill card has an "Add skill +" button highlighted with a green box.

5. Click **Connect app**.

Added

Connected

8. Try one of the prompts you created for your skill.

Prompt:

Gather zOS facts

The screenshot shows the IBM Watsonx Assistant interface. At the top, it says "IBM Watsonx Orchestrate" and "Personal skills". On the right, there are language settings for "English" and a blue "Aj" button. The main area displays a message from Watson: "Hi, I'm Watson. Check out the skills in the catalog to see how I can help you." Below this, a green button labeled "Gather z/OS facts" is highlighted. A green dashed box encloses the results of this skill: "z/OS Gather Facts", "status: pending", and "job: 12". At the bottom, there's a blue input bar with the placeholder "Tell me what you want to do". To the left, a blue box contains the text "Add skills from the catalog" with an arrow pointing right. To the right, another green dashed box encloses the "Ansible Controller Skills - z skills" section, which has a "2 skills" badge.

You should now be able to run the skill through the assistant preview.

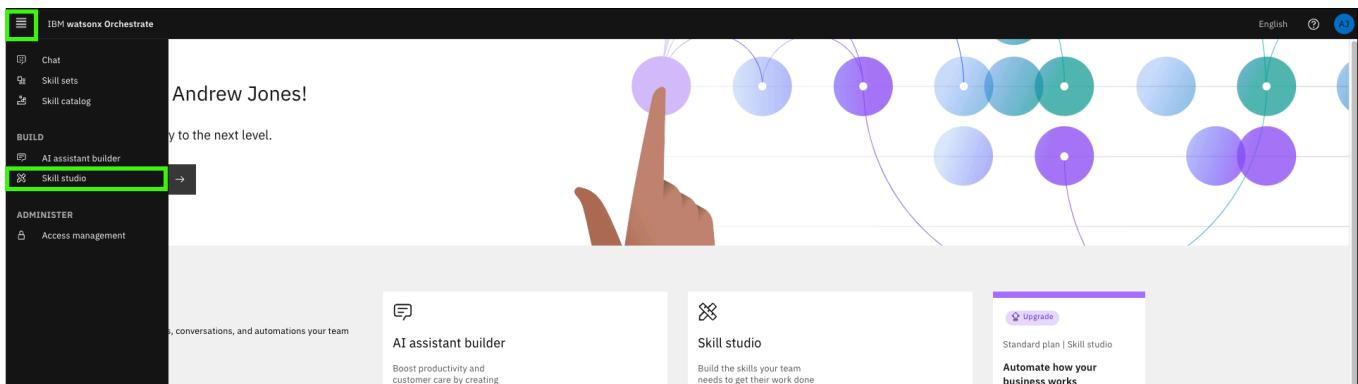

Creating skill flows

As seen in the previous section, running the Ansible skill to **Gather z/OS facts**, the skill executed successfully and was verified within the Ansible Automation Platform (AAP) console by viewing the job output. However, the output wasn't displayed by the assistant. To enable this scenario, a skill flow is needed. Skills are often more valuable when combined with other skills. You can create a skill flow to use two or more skills together to finish a task (like returning the output of a previous skill). When you create a skill flow, you map the output of one skill as the input for subsequent skills. Learn more about creating skill flows [here](#).

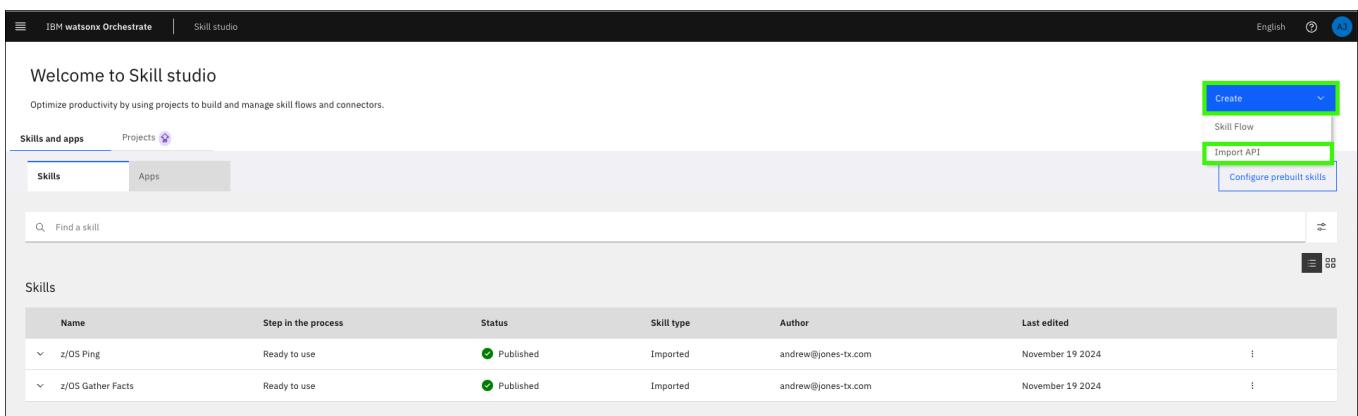

As mentioned in a previous section, there are some default utility skills that are provided out of the box with the "Z Skills Accelerator" which are leveraged to return the output of a skill. To accomplish this, we will import the Ansible Utility skill called **Retrieve job output**.

Add the utility skill

1. Open IBM watsonx Orchestrate **Skill studio**.

2. Expand **Create** and click **Import API**.

3. Click the **z/OS Skills accelerator (Trial)** tile.

The screenshot shows the 'Skill studio' tab selected in the top navigation bar. Below it, the 'Add skills' section is displayed. At the top left, there are two radio buttons: 'Choose the source' (selected) and 'Select the skills'. Below these are three buttons: 'From an app', 'From a file', and 'OpenAPI builder (experimental)'. A green box highlights the 'z/OS Skills accelerator (Trial)' card, which contains the text: 'Import your Ansible, JCL/REXX automation to Watsonx Orchestrate'. To the right of this card are cards for 'UiPath', 'IBM Robotic Process Automation (RPA)', and 'IBM Business Automation Workflow as a service'.

4. Enter the following values in the **z/OS Skills accelerator** form and then click **Connect**.

Use the **URL**, **User Name**, and **Password** values recorded in the **Explore Ansible Automation Platform** section earlier.

a: Connection Type: `ansible`

b: Application Name: <use the same application name as in previous section>

c: Connection URL: <enter the URL for your AAP UI>

d: User Name: <enter the AAP User Name (for UI access)>

e: Password: <enter the AAP User Password>

f: Search Pattern: `*`

The screenshot shows the configuration dialog for the 'z/OS Skills accelerator (Trial)'. On the left, the 'Add skills' section is visible with the 'z/OS Skills accelerator' card selected. On the right, the configuration fields are shown: 'Connection Type' (a) set to 'ansible', 'Application Name' (b) set to 'z', 'Connection URL' (c) set to 'https://itzvi-aap-phdhuzza.techzone.ibm.com', 'User name' (d) set to 'admin', 'Password' (e) set to '*****', and 'Search Pattern' (f) set to '*'. At the bottom right are 'Cancel' and 'Connect' buttons, with 'Connect' highlighted in blue.

5. Expand **Ansible Utility Skills** and click **Ansible Utility Skills**.

6. Select **Retrieve job output** and click **Save as draft**.

7. Click the ellipses (...) for the **Retrieve job output** skill and select **Enhance this skill**.

8. Review the skill settings and then click **Publish**.

Added ✓

Added ✓

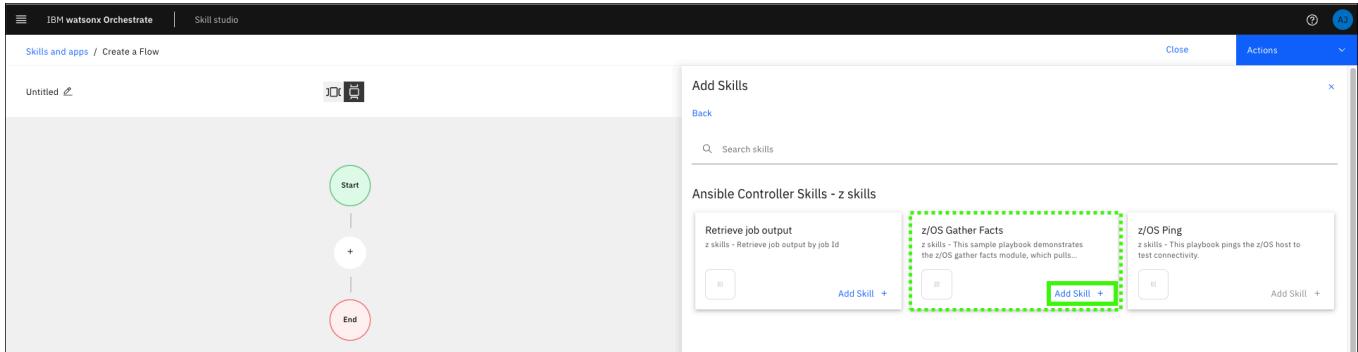

- Expand the **Create** drop-down menu and click on **Skill flow**.

3. Click the + icon.

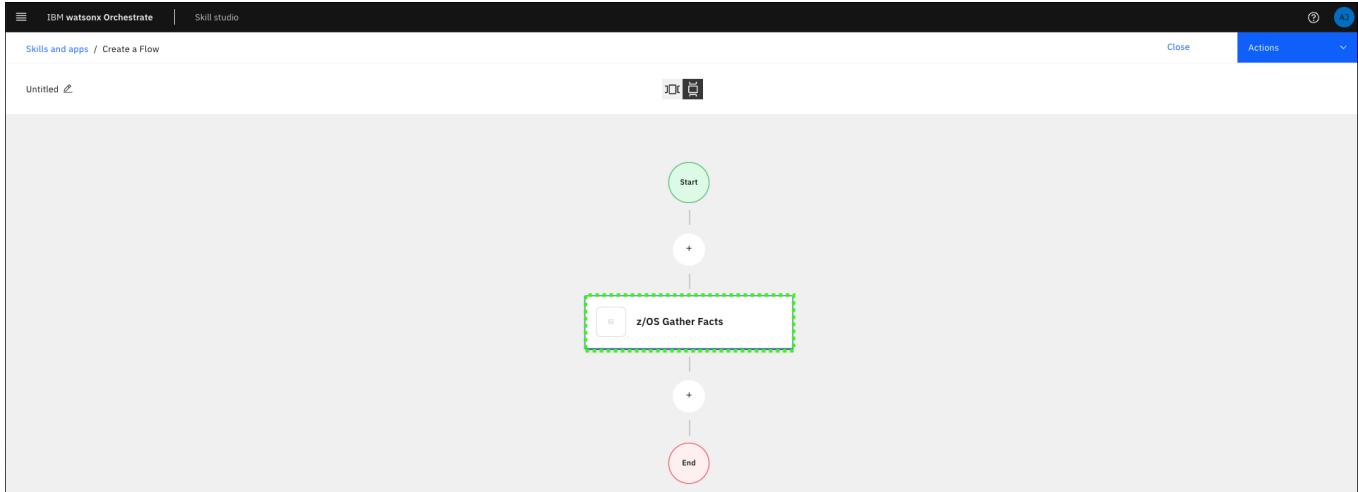

Next, you need to add the [z/OS Gather Facts](#) skill and the [Retrieve job output](#) skill to the skill flow. Use the **Search apps** function to locate the skills.

4. Search for the application name you specified earlier and click its tile.

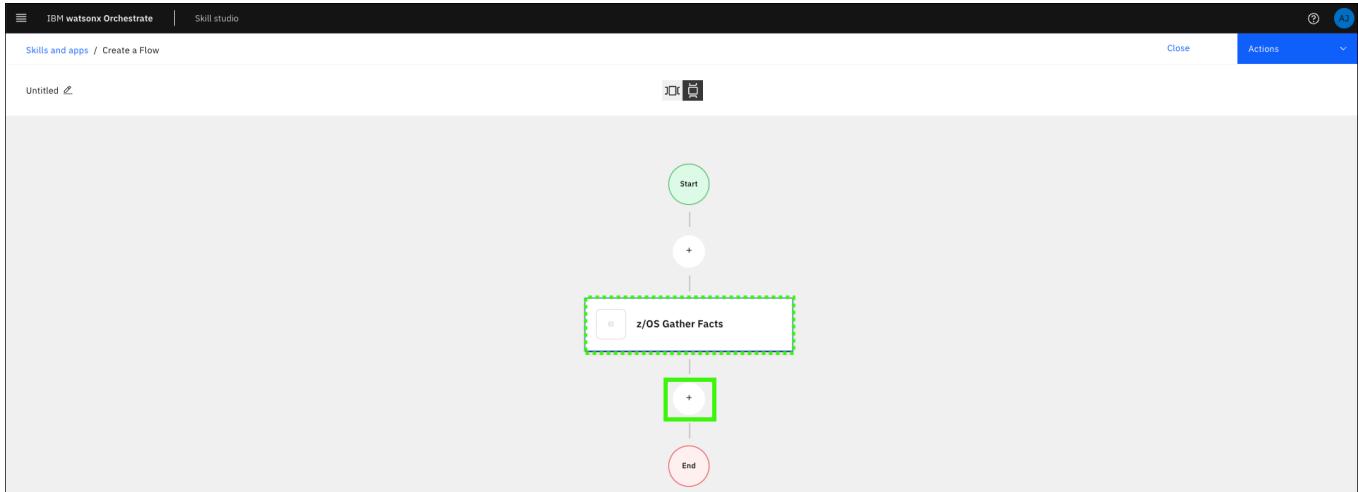

5. Click **Add Skill** in the [z/OS Gather Facts](#) tile.

6. Verify the **z/OS Gather Facts** skill is added to the skill flow.

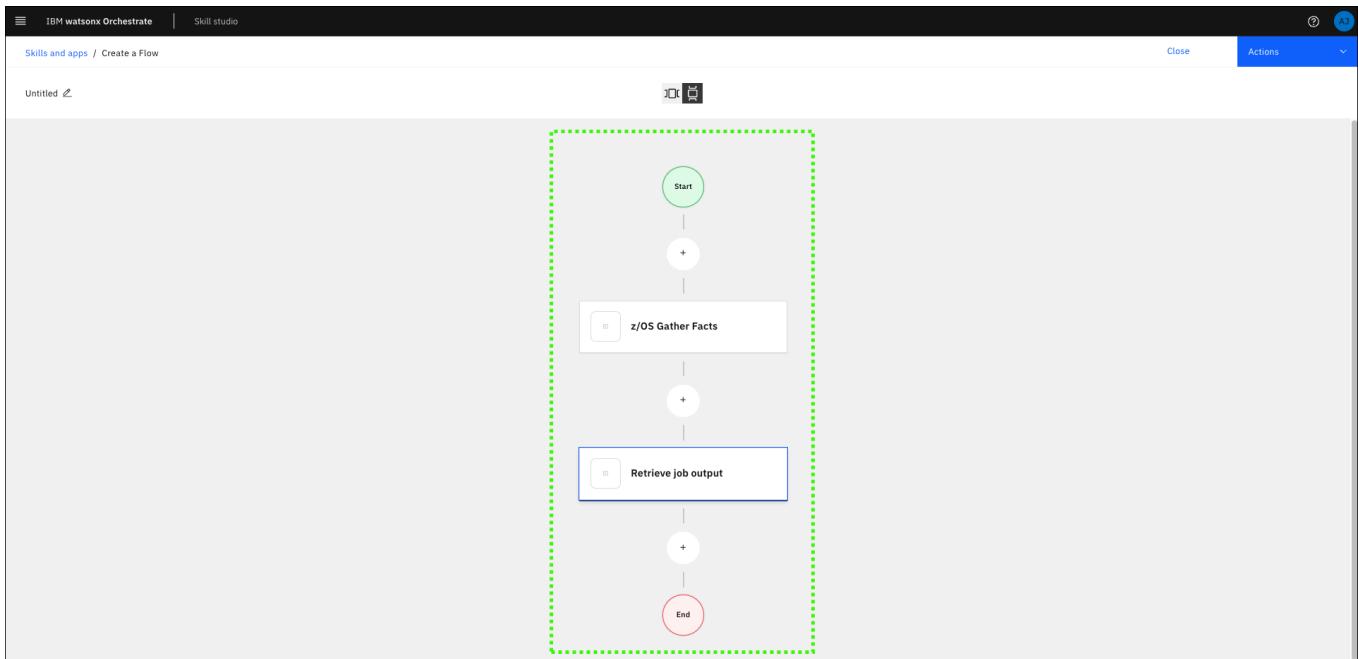

7. Click the **+** icon after the **z/OS Gather Facts** tile.

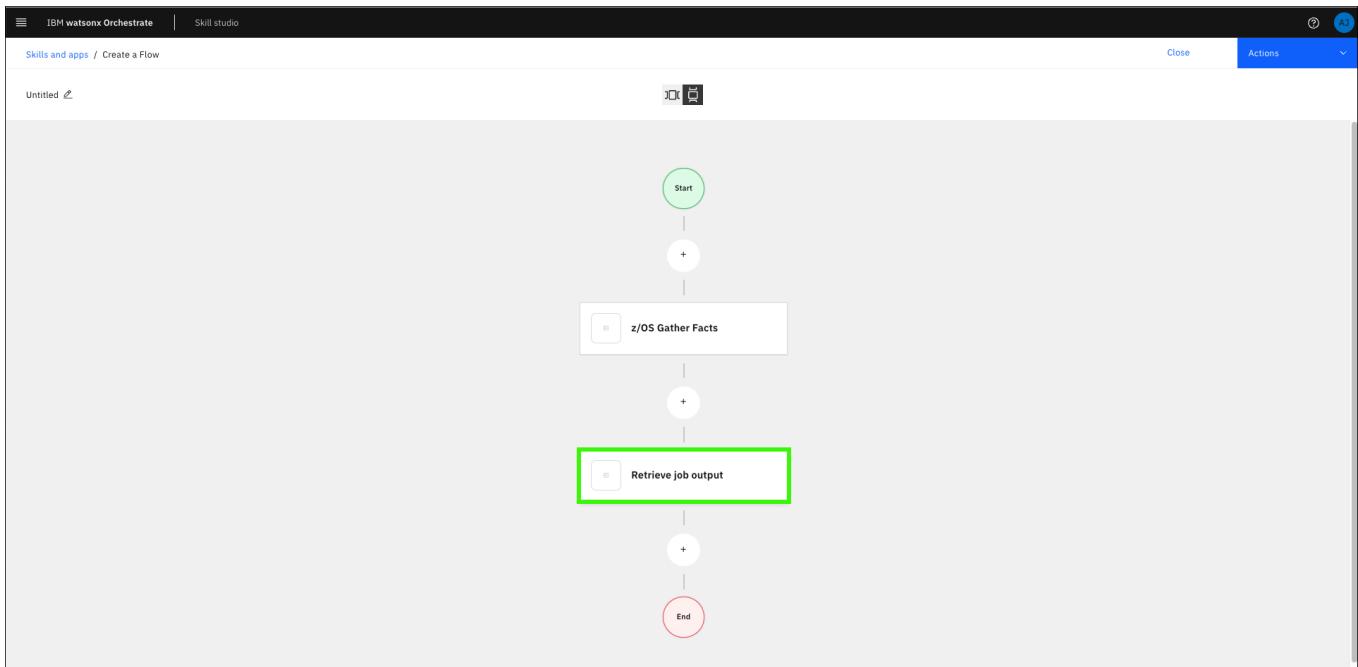

8. Repeat steps 5 and 6 for the **Retrieve job output** skill.

After adding the **Retrieve job output** skill, your skill flow should look like:

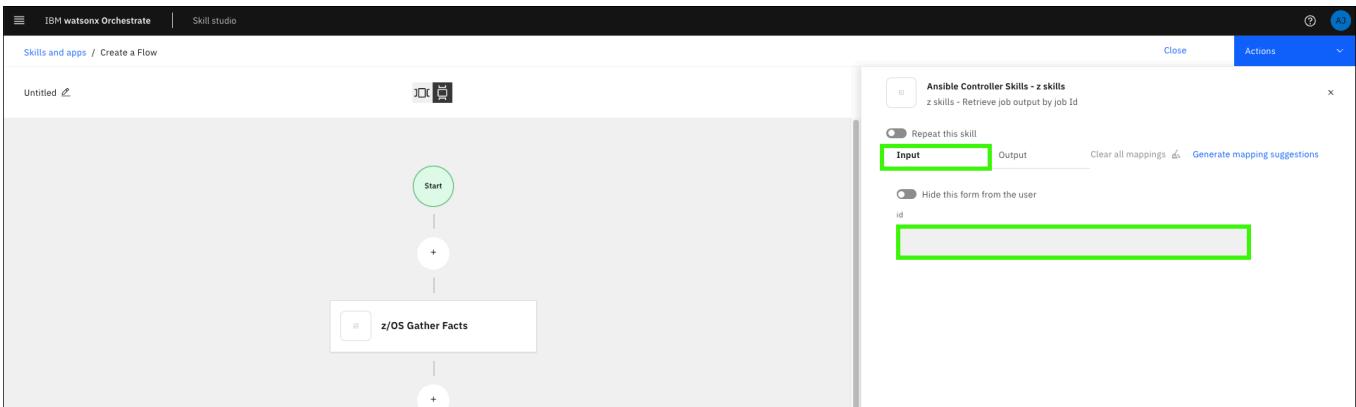

Next you must map the output values of the first skill to the input of the second skill. In this case, pass the "job id" output from **z/OS Gather Facts** as an input for **Retrieve job output**.

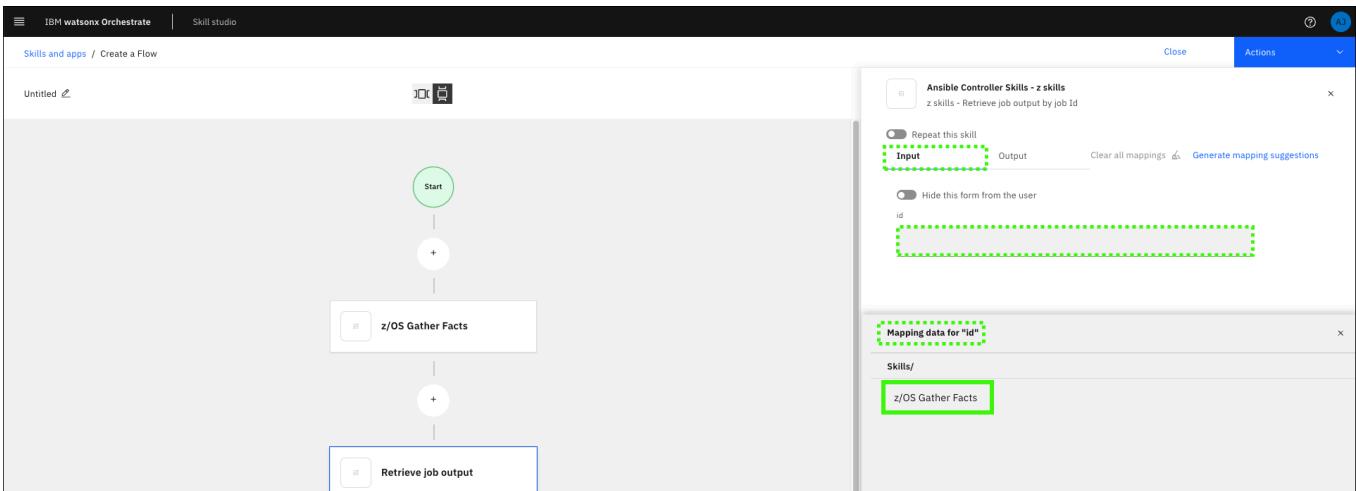

9. Click the **Retrieve job output** tile.

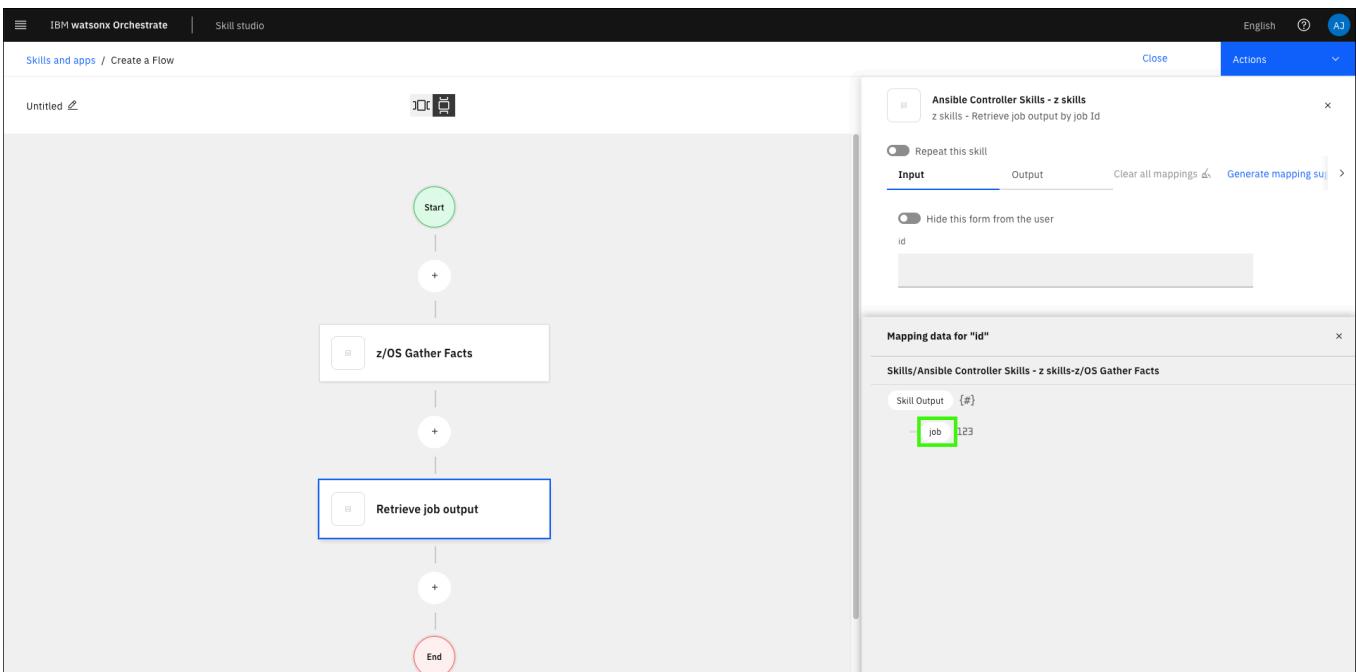

10. Select the **Input** tab and click in the **id** field.

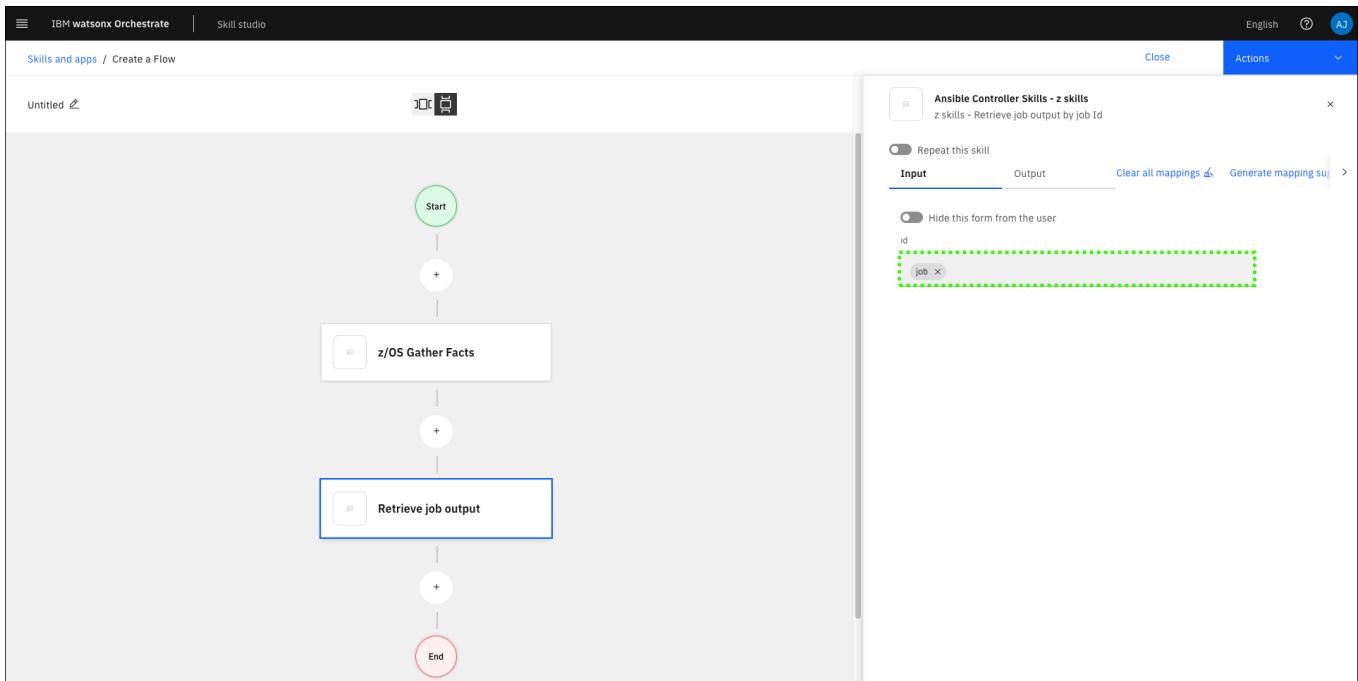

11. Click the **z/OS Gather Facts** skill in the **Mapping data for "id"** section.

12. Click the **job** icon.

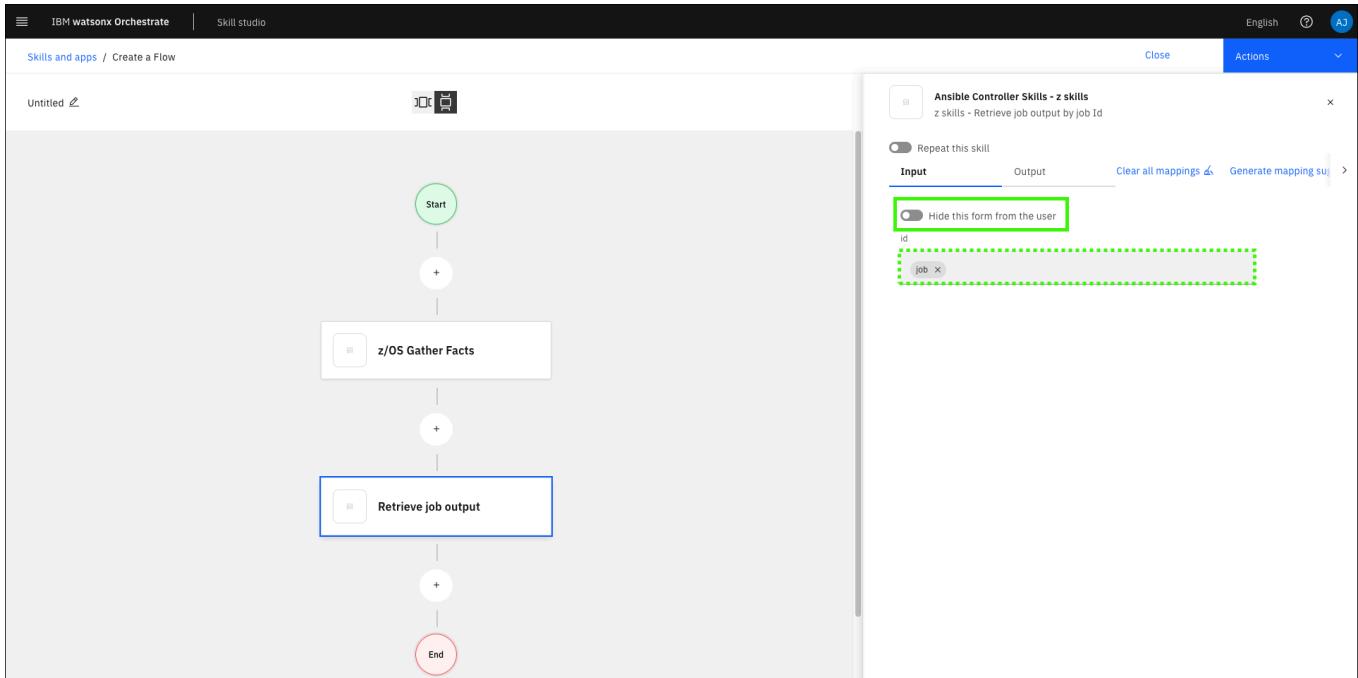

13. Verify the **job** appears in the **id** field.

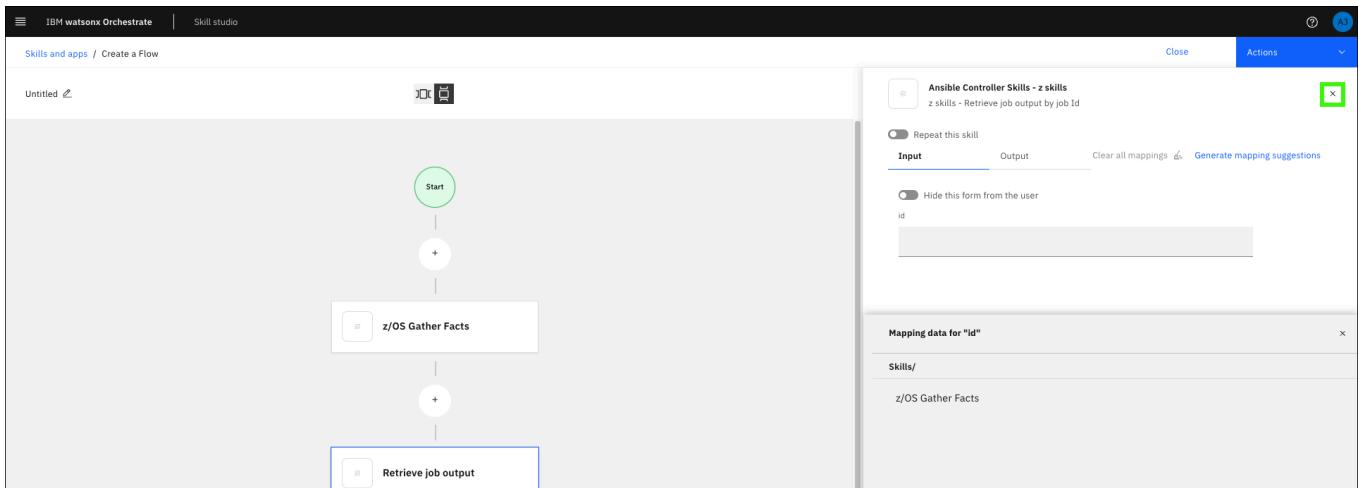

14. Optionally, toggle the **Hide this from from the user** setting.

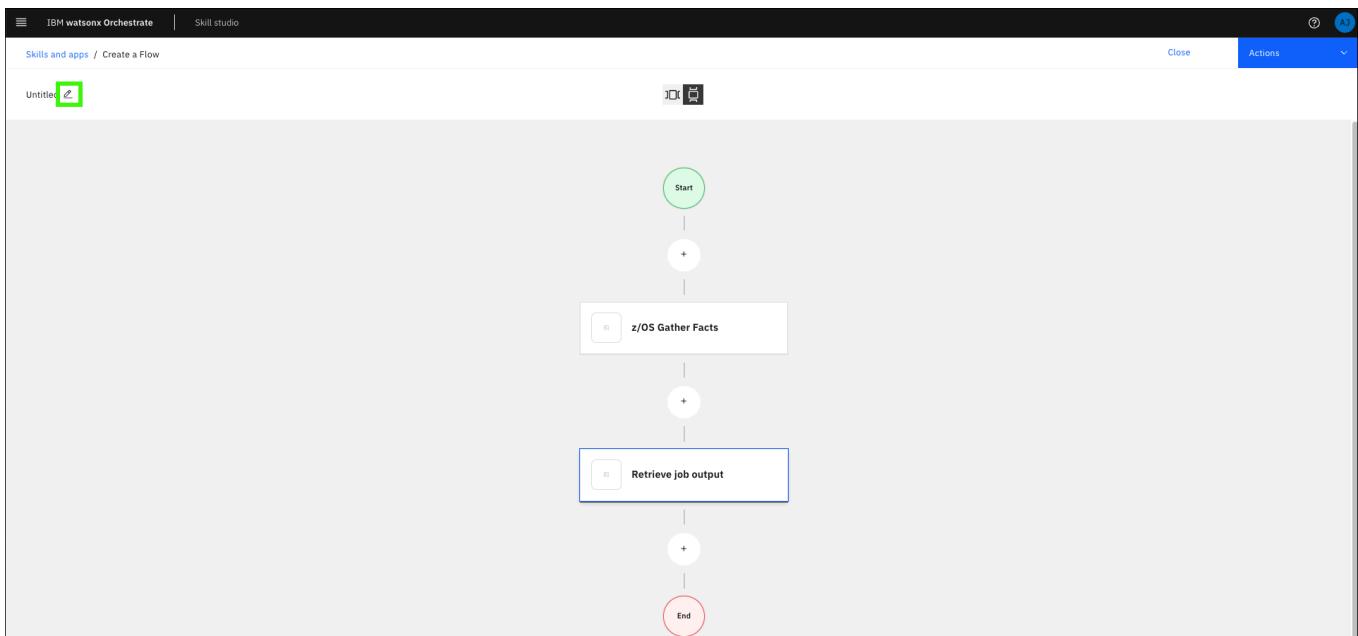

For this lab guide, this option is left disabled. Learn more about this option [here](#).

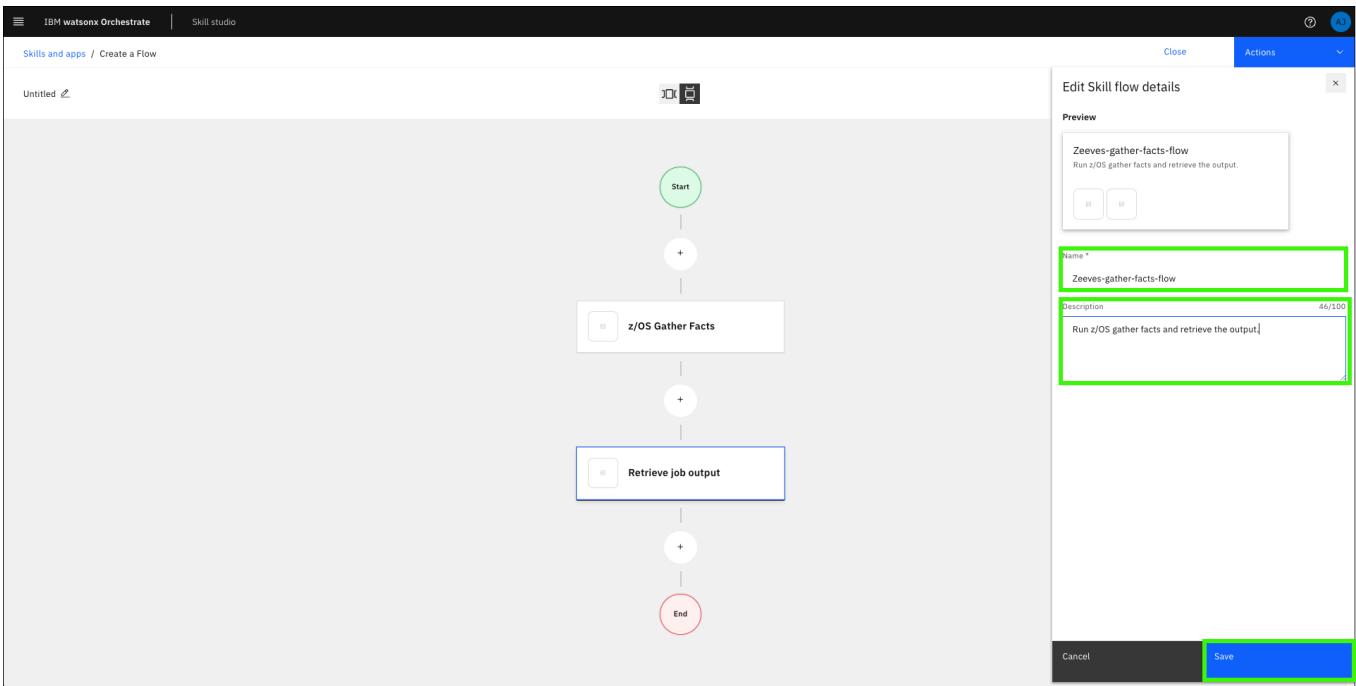

15. Click the x to close mapping window.

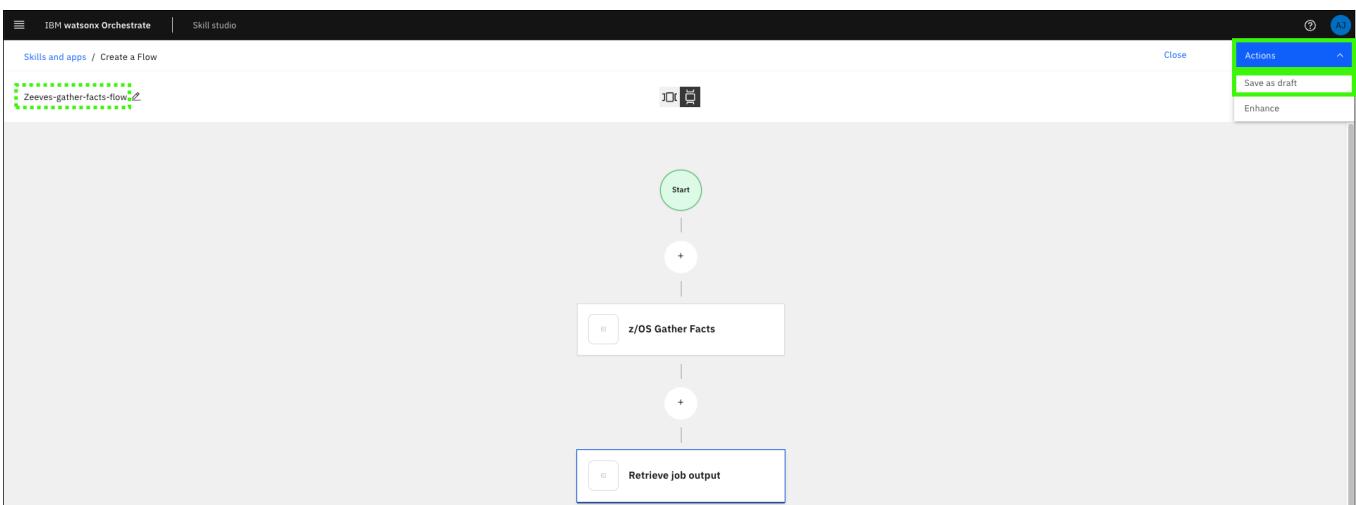

16. Click the pencil (✍).

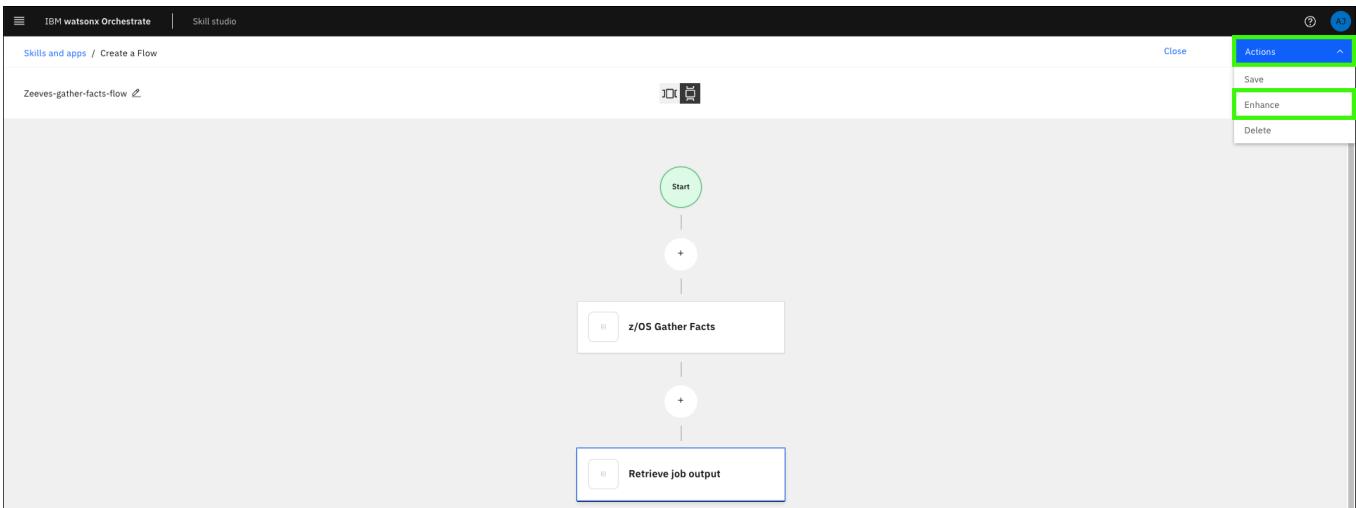

17. Enter a (a) Name and (b) Description for your skill flow and then (c) click Save.

18. Expand the **Actions** pull-down list and click **Save as draft**.

19. Expand the **Actions** pull-down list and click **Enhance**.

On the **Enhancing the skill** pages, you can:

- modify the skill name, description, and version
- add phrases (prompts) that will be recognized by the assistant to call the skill flow

20. Click the **Phrases** tab.

21. Replace the existing **phrases** (prompts) and then click **Publish**.

Notice the default prompts are either not very intuitive (the skill flow name) or a bit verbose. Replace the existing phrases with phrases that you anticipate users will enter.

Be careful with the sample phrases you specify.

During the development of the lab guide, it was discovered that some sample phrases with a `/` character can cause issues with the actions. Avoid using `z/OS` in your sample phrases. This issue has been reported to the offering team.

Example prompts:

Show me zOS facts

Gather and display zOS facts

Name **Phrases** Next best skills

Phrases are the text your user types in the chat bar to find and use a skill.

Show me zOS facts

Gather and display zOS facts

Enter new train phrase

Cancel **Publish** Save as draft

Enable the skill flow in your assistant

1. Click **AI assistant builder** in the main menu.

Configure prebuilt skills

2. Hover over the **Home (🏠)** and click **Actions**.

The screenshot shows the 'Actions' section of the AI assistant builder. On the left, there's a sidebar with options like 'Home', 'Generative AI', 'Actions' (which is selected), 'Preview', 'Deploy', 'Publish', 'Environments', 'Improve', and 'Analyze'. The main content area has a heading 'Actions' with a sub-section 'Build actions'. Below it are several tiles: 'Customize your greeting', 'Create a fallback plan', 'Preview & debug', 'Customize web chat', 'Set up a channel', 'Set up live agent', and 'Public assist'. At the bottom, there's a diagram showing a flow from 'Default behavior' to 'General purpose' and 'Conversational search', which then lead to a 'Search' box. A 'New' button is located in the top right corner of the main content area.

3. Click New action.

This screenshot shows the 'Actions' list page. The left sidebar includes 'Actions', 'All items', 'Created by you' (which is selected), 'Set by assistant', 'Variables', 'Created by you', 'Set by assistant', 'Set by integration', and 'Saved responses'. The main area displays a table of actions. The first row, 'z/OS Gather Facts', has columns: Name (z/OS Gather Facts), Last edited (2 hours ago), Examples count (2), Steps count (0), and Status (green). In the top right corner of the table header, there is a 'New action +' button.

4. Click the Skill-based action tile.

This screenshot shows the 'Create action' wizard. The first step asks 'What kind of action do you want to build?'. It offers three options: 'AI-guided action' (blue background), 'Skill-based action' (purple background, highlighted with a green border), and 'Custom-built action' (green background). Each option has a brief description and a 'Next' button at the bottom. A note at the bottom says 'Not sure how to start? Try adding pre-built action templates.'

5. Click the skill flow you created earlier and then click Next.

Note: it may take a minute for the tiles to appear on the screen.

System is training...

11. Click **Preview**.

The screenshot shows the 'Actions' section of the IBM Watsonx Orchestrator. On the left, there's a sidebar with categories like 'All items', 'Created by you', 'Variables', and 'Saved responses'. In the main area, a table lists one item: 'Zeeves-gather-facts-flow'. The table columns include 'Name', 'Last edited', 'Examples count', 'Steps count', and 'Status'. The 'Preview' button at the bottom right of the table is highlighted with a green box.

12. Enter one of the prompts you specified into the assistant preview.

The screenshot shows the 'Preview' window of the AI assistant builder. It displays a conversation between a customer and an AI assistant. The customer asks 'Show me zOS facts'. The AI assistant responds with 'Welcome, how can I assist you?' and then 'Show me zOS facts'. The 'Apply' button at the bottom right of the preview window is highlighted with a green box.

13. Wait 10 seconds and then click **Apply**.

Note: It is important to wait for the first job to complete before submitting the second job in the flow.

The screenshot shows the IBM Watsonx Orchestrate interface. On the left, there's a sidebar with 'Actions' selected. Under 'Created by you', there's a list of items, with 'Zeeves-gather-facts-flow' selected. The main area shows a table with one item selected. The preview window on the right shows a conversation between an AI and a user. The AI says 'Welcome, how can I assist you?' and 'Show me zOS facts'. The user responds with '8:13 AM'.

14. Review the results from the skill flow.

Use both scroll bars in the assistant preview to review all of the returned information. The output should be similar to what was seen in the AAP web console. The character strings like [0;32m are special characters that are not properly displayed in the assistant preview interface.

The screenshot shows the same interface as before, but the preview window now displays a large amount of JSON-like data. A green dashed box highlights a portion of the data, which includes key-value pairs such as 'ipl_volume': 'D25VS', 'load_param_device_id': '5', and 'operator_prompt_flag': 'true'.

Sample output from the z/OS gather facts flow.

```

The scenario shown above may or may not be relevant for your client's use case. It is intended to show you how to sequence skills together in a skill flow to create an action that your assistant triggers based on prompts using the pre-configured Ansible automation templates. You are encouraged to create your own skill flows and prompts using other skills available within the AAP instance. As an example, create a skill flow for the **z/OS Ping** skill. Be sure to add the **Retrieve job output** skill to view the results.

Next, learn about custom-built actions.

Creating custom-built actions

To this point, you have learned how to:

- import skills into Watson Assistant Orchestrate
- add applications with those skills to your assistant
- create skill-based actions for your assistant
- combine skills in a skill flow

There is also the ability to create **custom-built** actions. Custom-built actions allow you to create new actions with different steps to take in conversations and form sequences of prompts that define the conversation experience. The steps can be defined with or without conditions, which help control the custom responses. Steps within the custom action can end with routing to conversational search, triggering another existing sub-action, and other actions. This is a powerful way of customizing the end-user's experience.

Learn more about creating custom-built actions [here](#).

Importing pre-packaged z/OS skills

Provided with Version 2 of watsonx Assistant for Z is a set of pre-packaged skills which can be used to automate various tasks on z/OS, such as running different console commands and retrieving logs from batch jobs.

The list of pre-packaged skills available include:

- Authorized program list
- z/OS IPL Information
- Display zOS parmlib datasets
- Unix System services options
- Display zOS subsystems
- List spool files
- Retrieve dataset content
- Retrieve spool file content
- Retrieve z/OS Management Facility (OSMF) job status

IBM watsonx Orchestrate requires that any OSMF environment you connect to for skill execution has certificate authority (CA) signed certificates. In the case of the Ansible Automation Platform (AAP) & Wazi z/OS environment provisioned in IBM Technology Zone (ITZ), the z/OS system is not currently using CA signed certificates and therefore cannot execute the pre-packaged skills on your own z/OS system. For demo purposes, it is still recommended to import them so that the pre-packaged skills can be shown.

Work is in progress to modify the ITZ environments so that they are enabled for skill execution using these pre-packaged skills. In the meantime, the underlying automation for these pre-packaged skills can still be demonstrated using the Ansible skill 'z/OS Operator Command' which is available to import. This works because the pre-packaged skills are executing console commands directly using OSMF APIs which can also be run using the Ansible template skill 'z/OS Operator command'. For example, here are the console commands being used in some of the pre-packaged skills:

- Authorized Program list – `operator command -> d prog,lnklist`
- z/OS IPL Information - `operator command -> d iplinfo`
- Display zOS parmlib datasets - `operator command -> d parmlib`

You can import the pre-packaged skills into your sandbox environment by downloading the .zip file from [here](#) and following [these instructions](#).

You must extract the imbedded JSON file and modify the file for your environment by following [these instructions](#).

Publishing and deploying your assistant

To this point, acting as an Assistant Builder, you have built out the assistant, configured conversational search, and added skills and automations. While doing so, you have been testing your assistant using the **preview** capability of AI Assistant Builder. The **preview** capability is a closed environment for experimenting with prompts.

After your assistant is finalized, you can publish it to make it available to end-users. Each assistant you create comes with two **environments**: *draft* and *live*. You have been configuring your assistant in the draft environment. Each environment has its own set of IDs, URLs, and service credentials that can be referenced by external services.

The **Environments** page in the AI assistant builder has tabs for managing both the **Draft environment** and the **Live environment**:

This screenshot shows the 'Environments' page in the AI assistant builder. The 'Draft' tab is selected, indicated by a green dashed border. The 'Live' tab is also present. On the left, there's a sidebar with icons for environments, channels, and integrations. The main content area includes sections for 'Draft environment' (with a note about internal preview), 'Channels' (listing 'Web chat'), 'Resolution Methods' (mentioning 'Draft content'), and 'Extensions' (listing 'Search'). A 'Preview this environment' button is located in the top right corner.

This screenshot shows the 'Environments' page in the AI assistant builder. The 'Live' tab is selected, indicated by a green dashed border. The 'Draft' tab is also present. The main content area includes sections for 'Live environment' (with a note about deployment to customers), 'Channels' (listing 'Web chat'), 'Resolution Methods' (mentioning 'Content'), and 'Extensions' (listing 'Search'). A 'Publish version' button is located in the top right corner of the content area.

The **Draft environment** contains all your in-progress work in the Actions, Preview, and Publish pages. Use the **Draft environment** tab to build out your assistant and use for internal testing before deployment. Any integrations you use (i.e. channels) for the **Draft environment** are unique to that environment, and changes to draft integrations don't affect the **Live environment**.

Publish the assistant

Each time that you publish, you're creating a new version of the assistant, for example V1. When you publish your content, you're creating a snapshot of the draft content, resulting in a version.

Versions do not contain integration configurations or environment settings

Published versions contain all of the content from actions, including settings and variables. **However, versions do not contain integration configurations or environment settings.** Integration configurations and environment settings must be configured manually in each environment.

For managing quality-control and versioning, the Live environment is the version of the assistant you should be giving access to the end-user.

Follow these steps to publish the first version of your assistant using Assistant Builder:

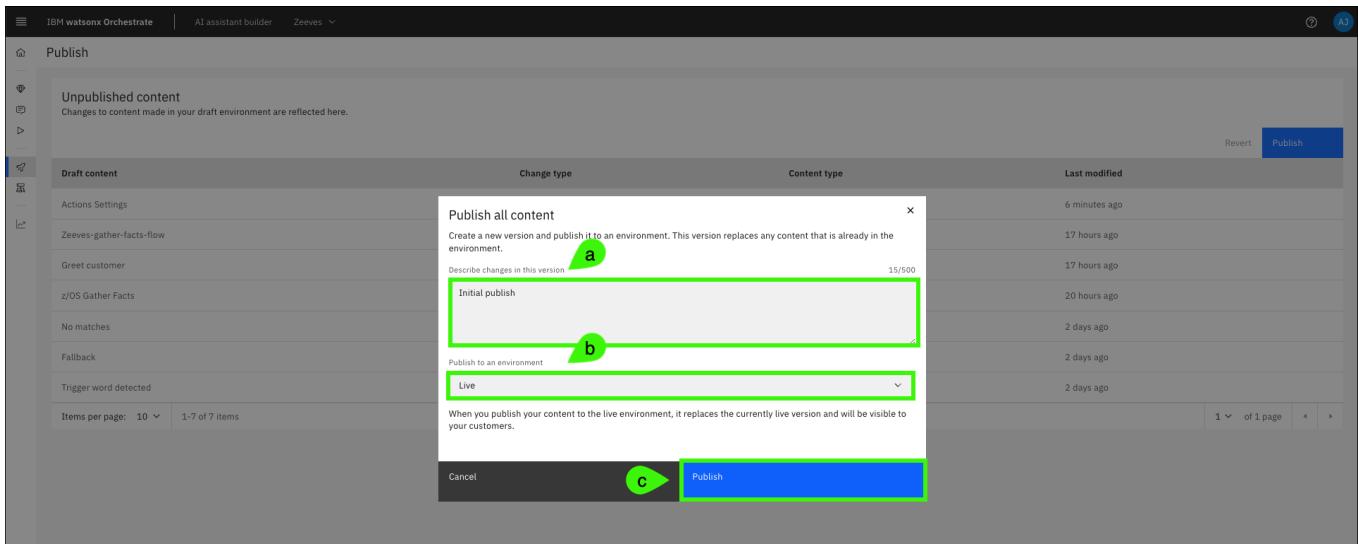

1. Hover over the **Home** icon () and click **Publish**.

The screenshot shows the 'Publish' step in the AI assistant builder. The 'Publish' button is highlighted with a green box. The interface includes sections for 'Build', 'Generative AI', 'Actions', 'Preview', 'Deploy', and 'Environments'. A sidebar on the left lists 'Analyze', 'Customize your assistant with these', and 'Structure'. Below the sidebar is a diagram showing a flow from 'Default behavior' to 'General purpose' and 'Conversational search', which then lead to a 'Search' node. A message at the top right says 'What's new' and 'Documentation'.

2. Click **Publish**.

The screenshot shows the 'Publish' step in the AI assistant builder. The 'Publish' button is highlighted with a green box. The interface displays a table of 'Draft content' changes, including items like 'Zeeves-gather-facts-flow', 'Greet customer', 'Actions Settings', 'Fallback', 'No matches', and 'Trigger word detected'. The table includes columns for 'Change type', 'Content type', and 'Last modified'. At the bottom, there are pagination controls and a note about page size.

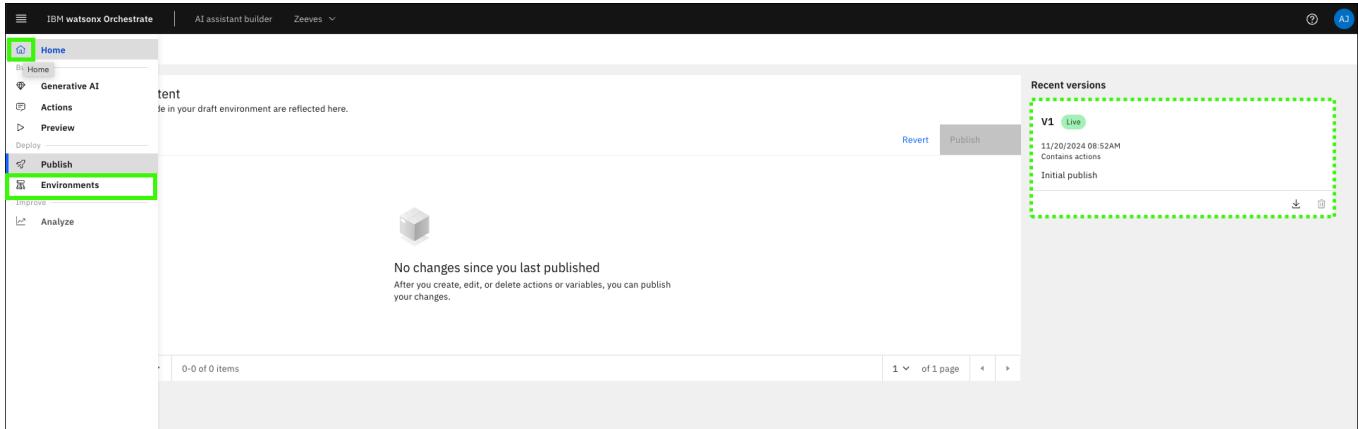

3. Enter a description of the changes (a), set the environment to **Live** (b), and then click **Publish** (c).

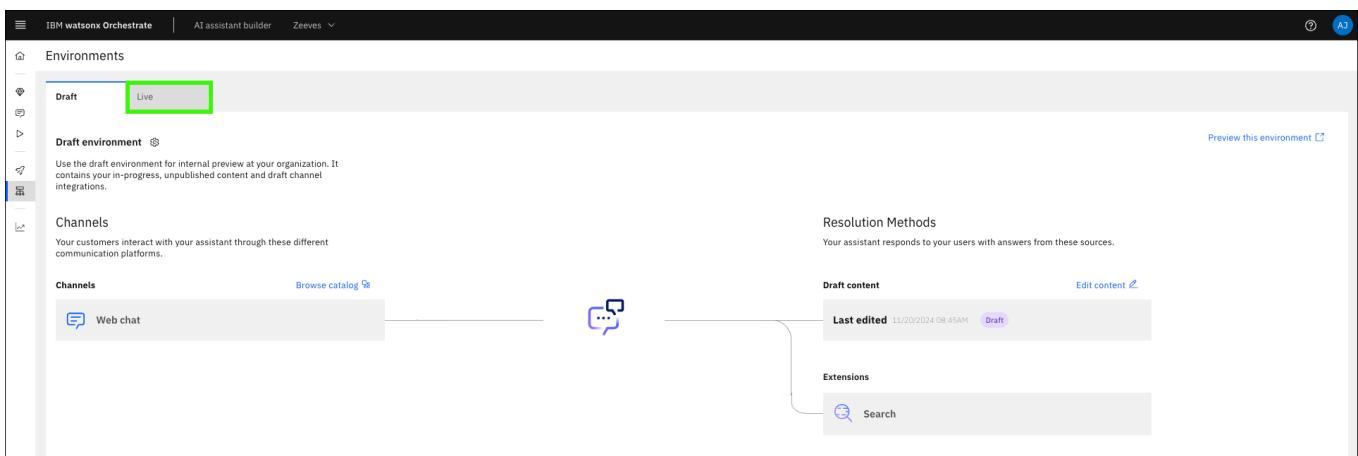

Configure the live environment

Important: When the live environment is created, the environment settings from the draft environment are not carried over (for example the configuration of the OpenSearch instance used for conversational search).

1. Hover over the Home icon (🏡) and click Environments.

2. Click Live.

3. Click Web chat.

The screenshot shows the IBM Watsonx Orchestrate interface. At the top, there are tabs for 'Draft' and 'Live'. The 'Live' tab is selected. Below it, under 'Live environment', there is a brief description: 'Use the live environment for deployment to customers. It contains your published content and channel integrations where customers interact with your assistant.' On the left, under 'Channels', there is a list with 'Web chat' highlighted by a green box. To the right, there are sections for 'Resolution Methods', 'Content' (version V1, 11/20/2024 08:52AM, status Live), and 'Extensions' (Search). A large blue arrow points from the 'Web chat' entry in the channels list towards the 'Content' section.

4. Customize the live assistant as you see fit.

On the **Style** tab, you're able to set the Assistant name which will be displayed at the top of the chat window when end-users are interacting with the assistant. For pilots or demos, you may want to personalize this name for the client. Also in the **Style** tab, you have the ability set the themes and display settings of the chat windows, including the ability to enable the IBM Watermark and enable streaming (recommended).

On the **Home** tab, you enable and customize a default greeting message from the assistant when the user accesses the assistant chat. You're also able to set Conversation starters that will be displayed in the chat window. When selected by the end-user, the text of these conversation starters are sent as prompts, so it is important that your assistant is trained and tested to answer appropriately. It is highly recommended to remove these default conversation starters and to consider creating your own as long as they're able to be executed as actions and provide value to the end-user. At the bottom of the Home screen tab, you will also see the ability to add a Background style for the assistant chat window.

Explore all the other tabs.

Customize your live environment.

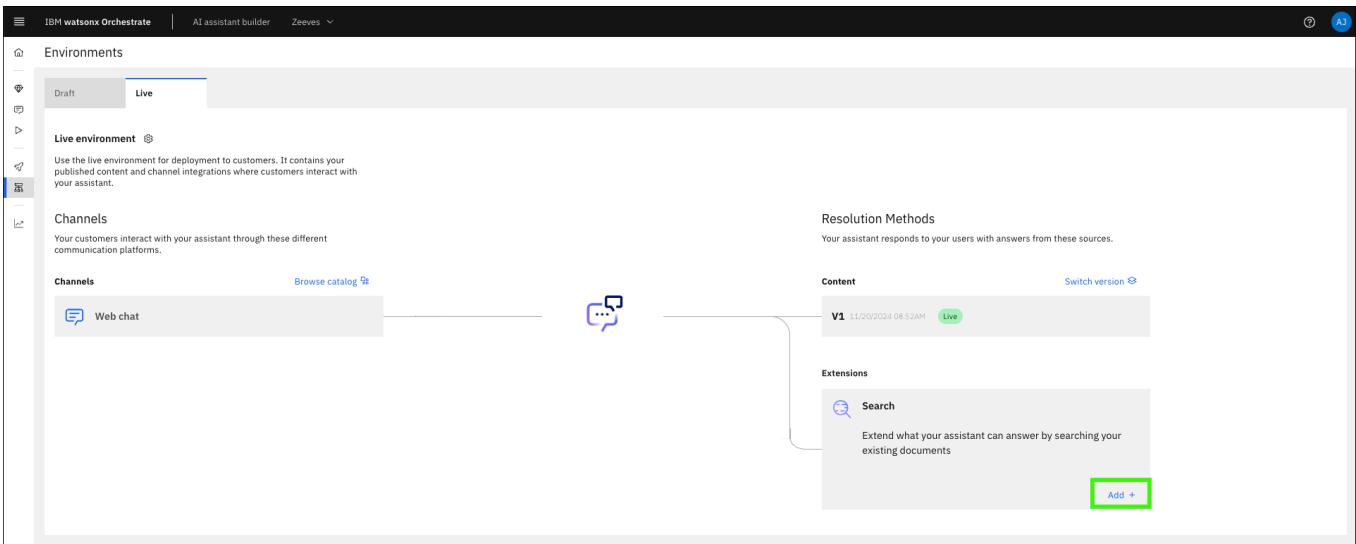

For this lab, toggle **Streaming** on and turn **Suggestions** off on the **Suggestions** tab. You may also want to change the theme to **Dark** to differentiate your draft and live environments.

The screenshot shows the 'Web chat' configuration page. The 'Style' tab is active. In the 'Intended purpose' section, the 'Standard: For virtual agents and customer support experiences.' radio button is selected. Under 'Choose a theme', the 'Dark' theme is chosen, highlighted by a green box. The 'Accent color' is set to #035AE9. The 'Size' section shows a width of 380px and a height of 640px. The 'IBM Watermark' and 'Streaming' sections both have their toggle switches set to 'On'. On the right, a preview window displays the configured chat interface with a dark background, a blue owl icon, and sample text messages.

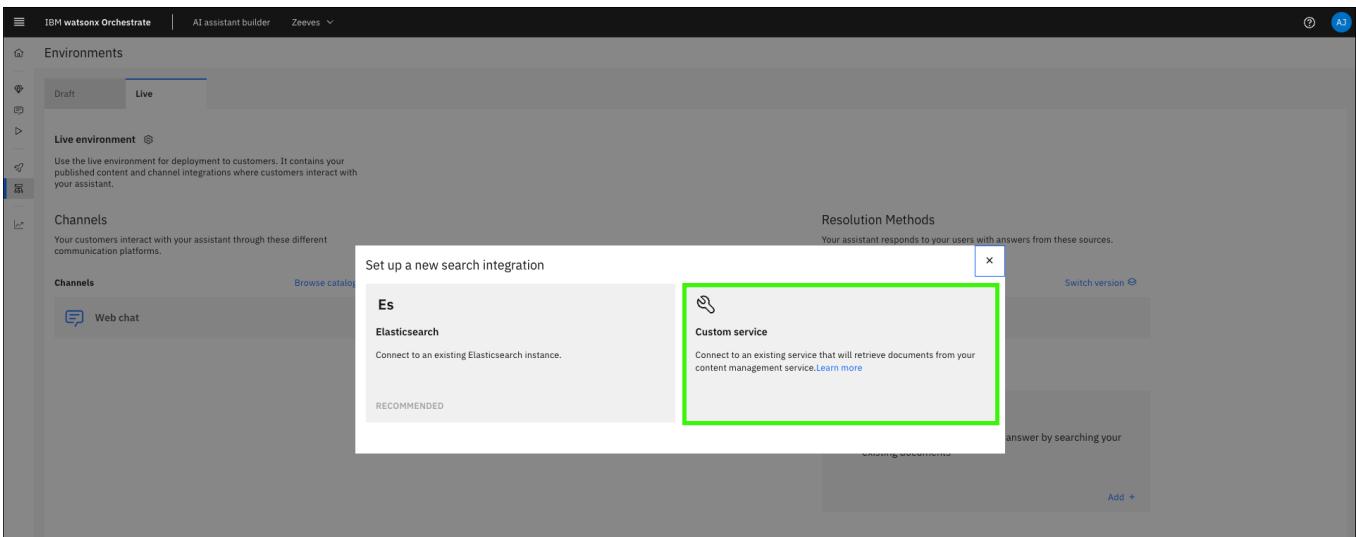

5. Click Save and exit.

This screenshot shows the same configuration page after the changes have been saved. The 'Save and exit' button is highlighted with a green box. The rest of the interface and preview window are identical to the previous screenshot.

6. Click Add in the Search tile.

7. Click Custom service.

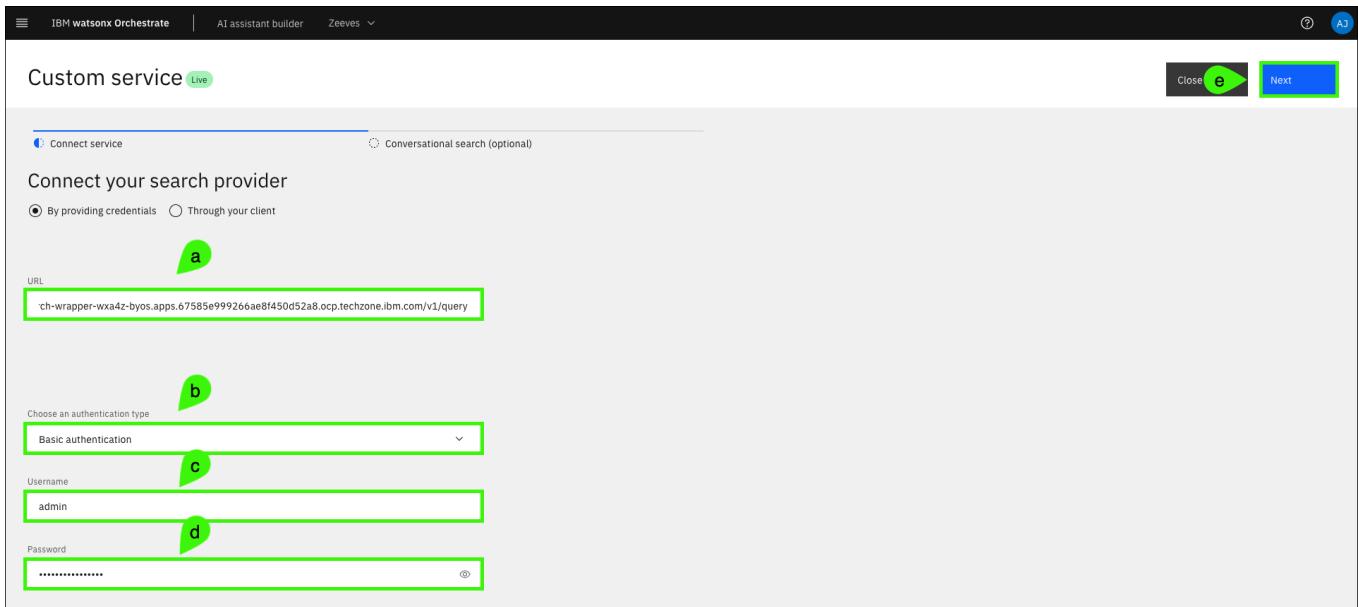

8. Enter the URL for your bring-your-own-search (BYOS) engine (a), select **Basic authentication** for the **authentication type** (b), enter **admin** for the **Username** (c), enter the password you specified in the `wrapper-creds.yaml` file for the **Password** (d), and then click **Next** (e).

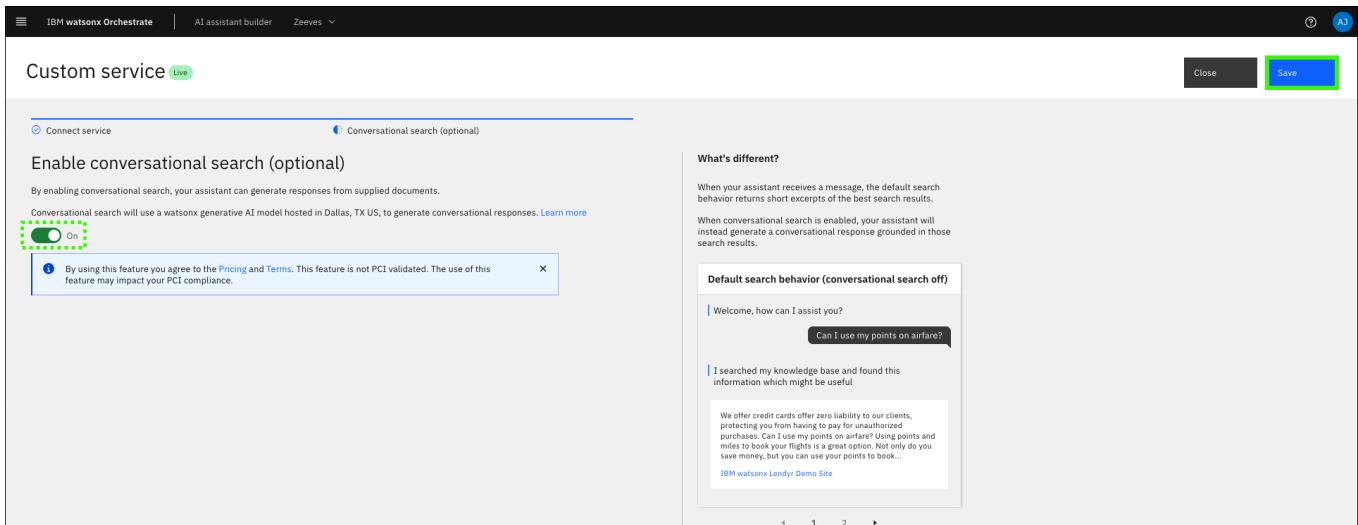

Use the correct URL and authentication type!

Use the URL and credentials for your BYOS OpenSearch engine created earlier [here](#).

9. Verify conversational search is enabled and click Save.

10. Update the **Custom service** settings (a-f), click **Save** (g), and then click **Close** (h).

Feel free to customize the settings.

This is your assistant. Feel free to customize the settings. The settings shown below reflect the changes made earlier in the lab guide to the draft version of the assistant. This includes the **Metadata** field to weigh ingested client documents higher using:

```
{
  "doc_weight": {
    "product_docs": 0.2,
    "customer_docs": 0.8,
    "ibm_indices": "*_ibm_docs_slate, *_ibm_redbooks_slate",
    "standardize": true,
    "customer_indices": "customer_*"
  }
}
```

The screenshot shows the 'Custom service' configuration page in the IBM Watsonx Assistant. Several UI elements are highlighted with green circles and letters:

- a:** A toggle switch labeled 'On' under 'Conversational search'.
- b:** A radio button labeled 'Single turn' under 'Conversational search'.
- c:** A radio button labeled 'Lowest' under 'Retrieval confidence threshold'.
- d:** A radio button labeled 'Verbose' under 'Generated response length'.
- e:** A radio button labeled 'Lowest' under 'Response confidence threshold'.
- f:** A code block containing JSON configuration for 'Metadata'.
- g:** A 'Save' button in the top right corner.
- h:** A 'Close' button in the top right corner.

The JSON code in section f is:

```
{
  "doc_weight": 1.0,
  "product_docs": 0.2,
  "customer_docs": 0.8,
  "ibm_indices": "**.ibm_docs.state",
  "customer_indices": ".customer_**"
}
```

Connect the skills to the live environment

1. Click **Skill sets** in the main menu.

The screenshot shows the IBM Watsonx Orchestrate interface. The left sidebar has sections: Chat, Skill sets (highlighted with a green border), Skill catalog, BUILD (AI assistant builder, Skill studio), and ADMINISTER (Access management). The main area displays 'Resolution Methods' with 'Content' (V1, 12/04/2024 03:22PM, Live) and 'Extensions' (Search). A central icon is a blue speech bubble with three dots.

2. Select your assistant's live instance in the **Skill sets** list.

The screenshot shows the 'Team Skills' page. The 'Skill sets' section lists 'Team Skills' (selected and highlighted with a green border), 'Orchestrator Agent Skillset', 'Team Skills', 'Zeeves draft', and 'Zeeves live'. Below this, there's a 'Name' section with a placeholder 'No skills' and a 'Manage skills' button. A note says 'Click Manage skills to give this team digest specific abilities.'

3. Click **Connections**.

The screenshot shows the 'Zeeves live' skill set page. The 'Skills' tab is selected (highlighted with a green border). Below it, there's a note about skills being available to team members. The 'Name' section lists 'z/OS Gather Facts', 'Zeeves-gather-facts-flow', and 'Retrieve job output'. At the bottom, there are pagination controls: 'Items per page: 10' and '1-3 of 3 items'.

4. Search for the application name you specified earlier.

Connect to Ansible Controller Skills - z skills

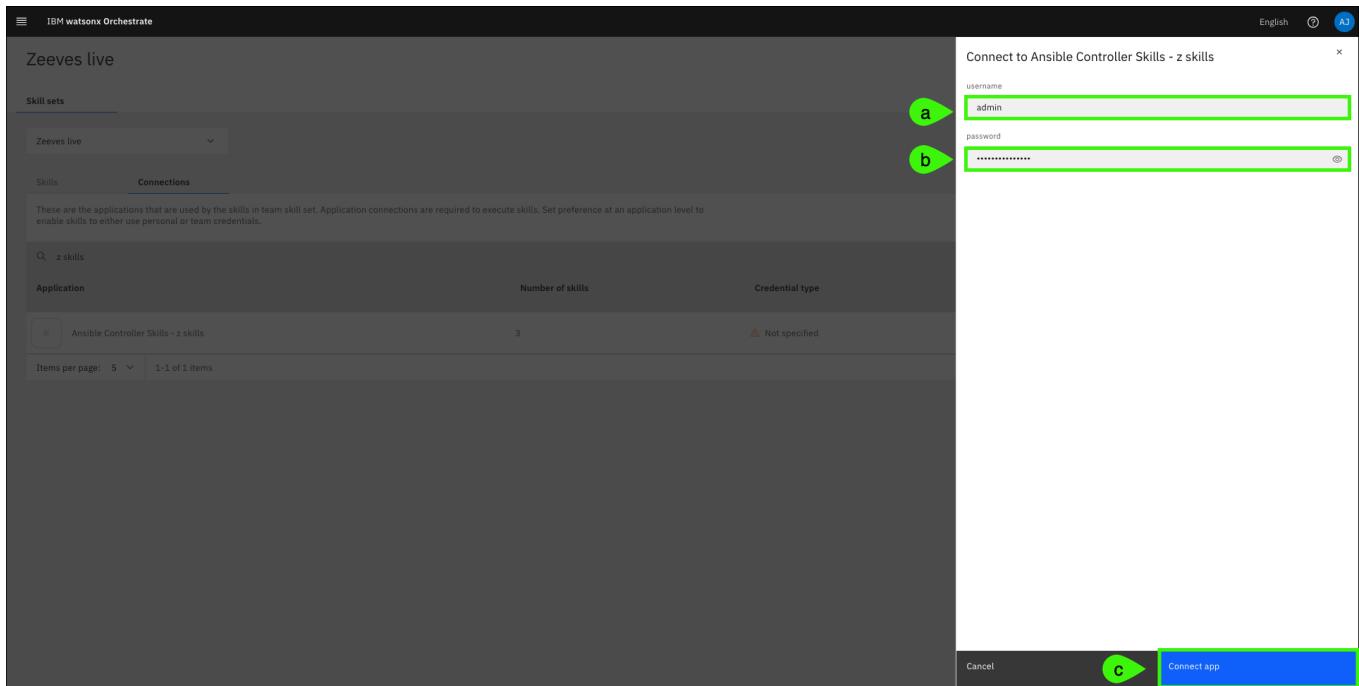

Member credentials
Each team member uses their own credentials to connect to this app and use its skills.

Team credentials
The admin sets the credentials each team member uses to connect to this app and use its skills.

You selected **Team credentials** for the credential type. Click **Connect app** to provide the credentials your team will use and to connect to the app.

Connect app

7. Enter the **username (a)** and **password (b)** using the username (admin) and password for your IBM Technology Zone (ITZ) watsonx Assistant for Z Pilot - AAP & z/OS reservation, and then click **Connect app (c)**.

Learn more about publishing your assistant and creating live environments [here](#).

Deploy the assistant

After configuring your assistant's settings and publishing, the final step is to deploy your assistant which can be done across various channels depending on the use case.

There are several options for deploying your assistant through channels and integrations to satisfy the use cases that you might address. Learn more about all the deployment options [here](#).

For this lab, you will deploy the assistant using the web chat integration. The web chat integration provides an assistant interface that can integrate with your website. There is a lot of flexibility with how you may want to integrate it. Learn more about the web chat integration [here](#).

1. Open the **Environments** page in [AI assistant builder](#).
2. Click **Web chat** for the **Live** environment.

The screenshot shows the IBM Watsonx Orchestrate dashboard. At the top, there are tabs for 'Environments' (Draft and Live), 'AI assistant builder', and 'Zeeves'. Below the tabs, under 'Live environment', there is a section titled 'Live environment' with a note: 'Use the live environment for deployment to customers. It contains your published content and channel integrations where customers interact with your assistant.' A 'Channels' section lists 'Web chat' (selected and highlighted with a green box) and 'Browse catalog'. To the right, there are sections for 'Resolution Methods' (Content and Extensions), 'Switch version', and a preview of the AI assistant's response.

3. Click the Embed tab.

The screenshot shows the 'Web chat' configuration page. The top navigation bar includes tabs for Style, Launcher, Home screen, Live agent, Suggestions, Security, **Embed** (selected and highlighted with a green box), and Resources. On the left, there is a 'Customize your chat UI' section with fields for Assistant's name, Intended purpose (Standard or Carbon for AI), theme (Light or Dark), colors, and size. On the right, there is a preview window showing the AI assistant's interface with an owl logo, the message 'Hi! I'm a virtual assistant. How can I help you today?', and a 'Type something...' input field.

4. Copy and record the integrationID, region, and serviceInstanceID values.

The screenshot shows the 'Web chat' configuration page with the 'Embed' tab selected. The 'Embed' section displays the embed code:

```

<script>
    var integrationID = "5e64c299-e6b0-434c-8e8c-275d409272f5"; // The ID of this integration.
    var region = "us-south"; // The region your integration is deployed to.
    var serviceInstanceID = "7c163381-8d8f-474b-bdd3-219f5232087bc"; // The ID of your service instance.
    const loadScript = (instance) => { await instance.load(); };
    setTimeout(function() {
        const t = document.createElement('script');
        t.src = "https://web-chat.global.assistant.watson.appdomain.cloud/versions/" + (window.watsonAssistantChatVersion || 0);
        document.head.appendChild(t);
    });
</script>

```

5. In a text editor, create a file named Watson Assistant Chat.html and paste the following text in the file.

File name:

Watson Assistant Chat.html

File contents:

```
<html lang="en">
<head>
<title>Watson Assistant Chat</title>
<meta name="viewport" content="width=device-width, initial-scale=1">

<style>
.WebChatContainer {
  position: absolute;
  left: 0;
  right: 0;
  top: 0;
  bottom: 0;
}
</style>
</head>
<body>

<div class="WebChatContainer"/>

<script>
const element = document.querySelector('.WebChatContainer');

window.watsonAssistantChatOptions = {
  integrationID: "<YOUR INTEGRATION ID>", // The ID of this integration.
  region: "<YOUR REGION>", // The region your integration is hosted in.
  serviceInstanceId: "<YOUR SERVICE INSTANCE ID>", // The ID of your service instance.
  element,

  openChatByDefault: true,
  hideCloseButton: true,

  layout: {
    showFrame: false,
    hasContentMaxWidth: true,
  },
  onLoad: async (instance) => {
    window.WACInstance = instance;
    await instance.render();
  }
};

setTimeout(function() {
  const t = document.createElement('script');
  t.src = 'https://web-chat.global.assistant.test.watson.appdomain.cloud/versions/' +
  (window.watsonAssistantChatOptions.clientVersion || 'latest') +
  '/WatsonAssistantChatEntry.js';
  document.head.appendChild(t);
});
</script>

</body>
</html>
```

Before modification:

6. Open the `Watson Assistant Chat.html` file in a web browser.

Your assistant is now live. Explore some of the earlier prompts to verify the assistant is accessing the ingested documents and your skills and skill flows are active.

⚠ Wait 5-10 seconds before clicking apply on skill actions.

Prompts to try:

What is z/OS continuous delivery?

Get z/OS facts

Show me z/OS facts

Gather and display z/OS facts

Adding other integrations

IBM watsonx Assistant for Z can integrate with other delivery channels beyond a web page. Other channels include Slack, Microsoft teams, WhatsApp, and many others. Integrating with these and other channels are not covered in the lab guide. However, follow the steps after this to find the current channels that are supported and where to get more information.

1. Hover over the Home () and click **Integrations**.

The screenshot shows the IBM watsonx Orchestrate interface. The left sidebar has sections like Build, Actions, Evaluate, Preview, Publish, Environments, Improve, and Analyze. The main area shows a flowchart of assistant configurations. A green box highlights the 'Integrations' section in the sidebar, which contains links for Activity log and Assistant settings. The main content area shows a flowchart with nodes like Default behavior, Zeeves, Actions, and Fallback, connected to various integration options like General purpose, Conversational search, AI-guided, Skill-based, Custom-built, and Live agent.

2. Explore the **Essential channels** and **Channels** sections.

The screenshot shows the Integrations screen. A green dashed box highlights the 'Essential channels' section, which includes a 'Web chat' tile with a phone icon and a 'Contact center integrations' section with icons for NICE, Genesys, and Twilio. Another green dashed box highlights the 'Channels' section, which lists third-party channels: SMS, Facebook messenger, Genesys Bot Connector, Slack, Microsoft teams, and WhatsApp with Twilio. Each channel has an 'Add' button next to its tile.

3. Click **Add** on the **Slack** tile.
